

# STM32F302xx STM32F303xx

ARM Cortex-M4F 32b MCU+FPU, up to 256KB Flash+48KB SRAM  
4 ADCs, 2 DACs, 7 comp, 4 PGA, timers, 2.0-3.6 V operation

Datasheet – production data

## Features

- Core: ARM® 32-bit Cortex™-M4F CPU (72 MHz max), single-cycle multiplication and HW division, DSP instruction with FPU (floating-point unit) and MPU (memory protection unit).
- Operating conditions:
  - $V_{DD}$ ,  $V_{DDA}$  voltage range: 2.0 V to 3.6 V
- Memories
  - 128 to 256 Kbytes of Flash memory
  - Up to 40 Kbytes of SRAM on data bus with HW parity check
  - 8 Kbytes of SRAM on instruction bus with HW parity check (CCM)
- CRC calculation unit
- Reset and supply management
  - Power-on/Power down reset (POR/PDR)
  - Programmable voltage detector (PVD)
  - Low power modes: Sleep, Stop and Standby
  - $V_{BAT}$  supply for RTC and backup registers
- Clock management
  - 4 to 32 MHz crystal oscillator
  - 32 kHz oscillator for RTC with calibration
  - Internal 8 MHz RC with x 16 PLL option
  - Internal 40 kHz oscillator
- Up to 87 fast I/Os
  - All mappable on external interrupt vectors
  - Several 5 V-tolerant
- 12-channel DMA controller
- Up to four ADC 0.20  $\mu$ S (up to 39 channels) with selectable resolution of 12/10/8/6 bits, 0 to 3.6 V conversion range, separate analog supply from 2 to 3.6 V
- Up to two 12-bit DAC channels with analog supply from 2.4 to 3.6 V
- Seven fast rail-to-rail analog comparators with analog supply from 2 to 3.6 V
- Up to four operational amplifiers that can be used in PGA mode, all terminal accessible with analog supply from 2.4 to 3.6 V
- Support for up to 24 capacitive sensing keys supporting touchkey, linear and rotary touchsensors

LQFP48 (7 × 7 mm)  
LQFP64 (10 × 10 mm)  
LQFP100 (14 × 14 mm)

- Up to 13 timers
  - One 32-bit timer and two 16-bit timers with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
  - Up to two 16-bit 6-channel advanced-control timers, with up to 6 PWM channels, deadtime generation and emergency stop
  - One 16-bit timer with 2 IC/OCs, 1 OCN/PWM, deadtime generation and emergency stop
  - Two 16-bit timers with IC/OC/OCN/PWM, deadtime generation and emergency stop
  - Two watchdog timers (independent, window)
  - SysTick timer: 24-bit downcounter
  - Up to two 16-bit basic timers to drive the DAC
- Calendar RTC with Alarm, periodic wakeup from Stop/Standby
- Communication interfaces
  - CAN interface (2.0B Active)
  - Two I<sup>2</sup>C Fast mode plus (1 Mbit/s) with 20 mA current sink, SMBus/PMBus, wakeup from STOP
  - Up to five USART/UARTs (ISO 7816 interface, LIN, IrDA, modem control)
  - Up to three SPIs, two with multiplexed I<sup>2</sup>S interface, 4 to 16 programmable bit frame
  - USB 2.0 full speed interface
  - Infrared Transmitter
- Serial wire debug, JTAG, Cortex-M4F ETM
- 96-bit unique ID

# 1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32F30x microcontrollers.

This STM32F30x datasheet should be read in conjunction with the STM32F30x reference manual. The reference manual is available from the STMicroelectronics website [www.st.com](http://www.st.com).

For information on the Cortex™-M4F core please refer to the Cortex™-M4F Technical Reference Manual, available from the [www.arm.com](http://www.arm.com) website at the following address:

<http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.subset.cortexm.m4/index.html>

## 2 Description

The STM32F302xx/STM32F303xx family is based on the high-performance ARM® Cortex™-M4F 32-bit RISC core operating at a frequency of up to 72 MHz, and embedding a floating point unit (FPU), a memory protection unit (MPU) and an embedded trace macrocell (ETM). The family incorporates high-speed embedded memories (up to 256 Kbytes of Flash memory, up to 48 Kbytes of SRAM) and an extensive range of enhanced I/Os and peripherals connected to two APB buses.

The devices offer up to four fast 12-bit ADCs (5 Msps), up to seven comparators, up to four operational amplifiers, up to two DAC channels, a low-power RTC, up to five general-purpose 16-bit timers, one general-purpose 32-bit timer, and two timers dedicated to motor control. They also feature standard and advanced communication interfaces: up to two I<sup>2</sup>Cs, up to three SPIs (two SPIs are with multiplexed full-duplex I2Ss on STM32F303xx devices), three USARTs, up to two UARTs, CAN and USB. To achieve audio class accuracy, the I2S peripherals can be clocked via an external PLL.

The STM32F302xx/STM32F303xx family operates in the -40 to +85 °C and -40 to +105 °C temperature ranges from a 2.0 to 3.6 V power supply. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F302xx/STM32F303xx family offers devices in three packages ranging from 48 pins to 100 pins.

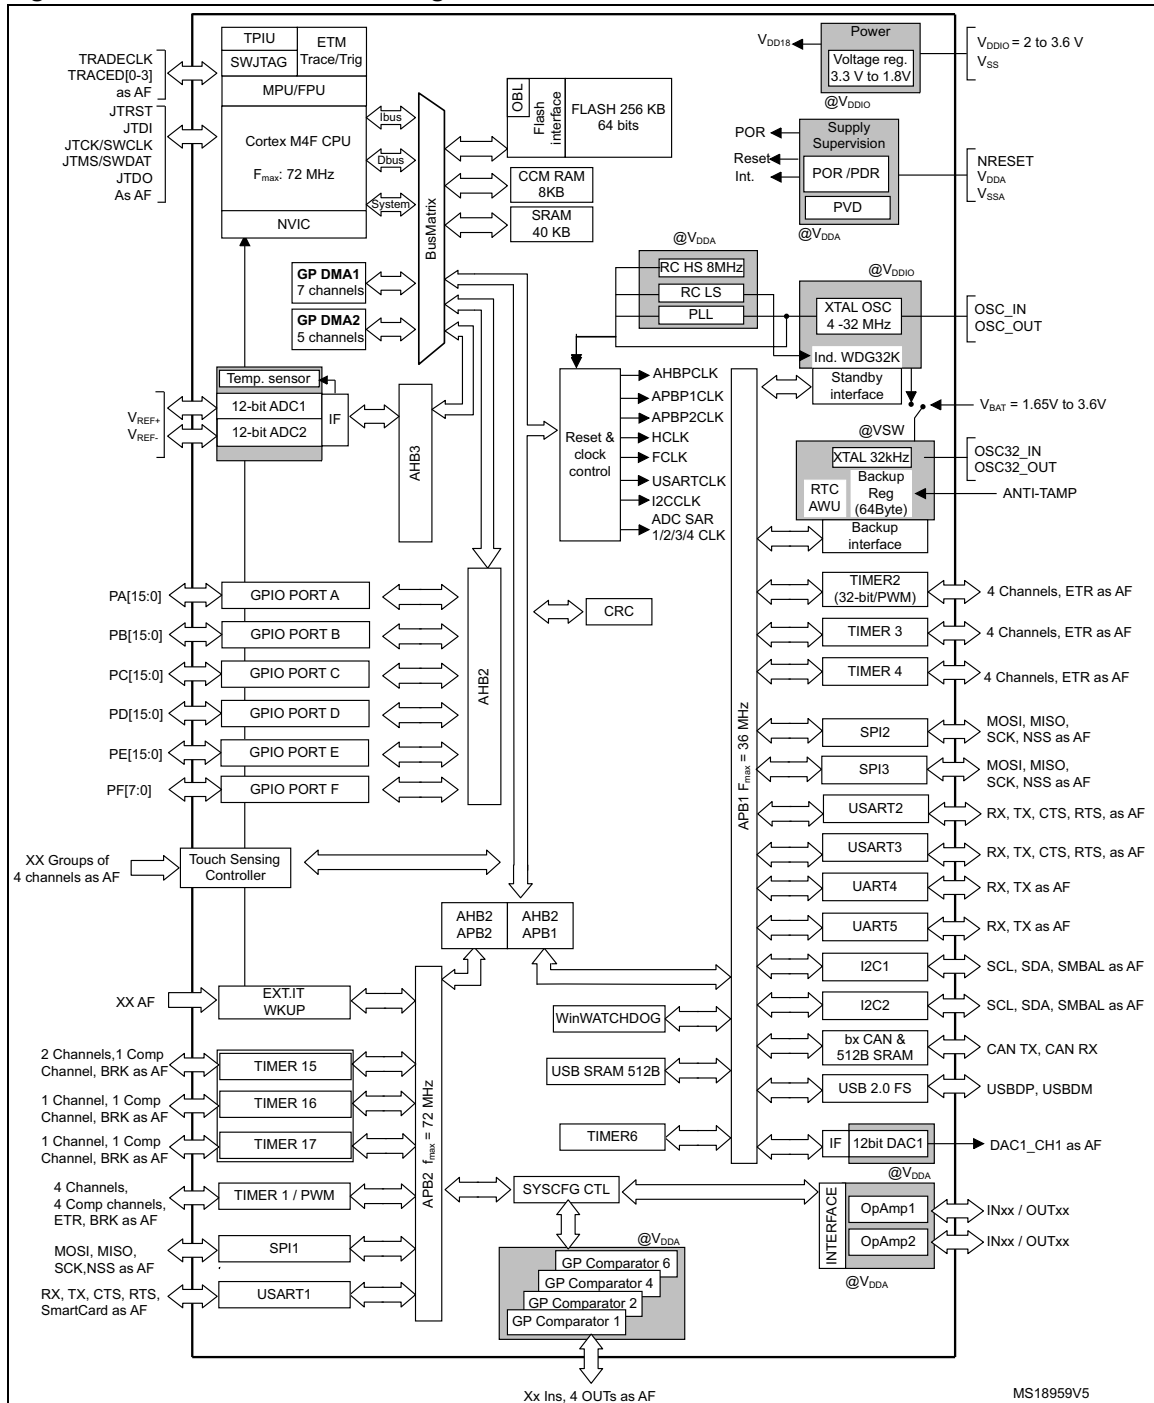

The set of included peripherals changes with the device chosen.

**Table 2. STM32F30x family device features and peripheral counts**

Peripheral		STM32F 302Cx		STM32F 302Rx		STM32F 302Vx		STM32F 303Cx		STM32F 303Rx		STM32F 303Vx

## 3 Functional overview

### 3.1 ARM® Cortex™-M4F core with embedded Flash and SRAM

The ARM Cortex-M4F processor is the latest generation of ARM processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts.

The ARM Cortex-M4F 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

The processor supports a set of DSP instructions which allow efficient signal processing and complex algorithm execution.

Its single precision FPU speeds up software development by using metalanguage development tools, while avoiding saturation.

With its embedded ARM core, the STM32F302xx/STM32F303xx family is compatible with all ARM tools and software.

*Figure 1* and *Figure 2* show the general block diagrams of the STM32F302xx/STM32F303xx family devices.

### 3.2 Memory protection unit

The memory protection unit (MPU) is used to separate the processing of tasks from the data protection. The MPU can manage up to 8 protection areas that can all be further divided up into 8 subareas. The protection area sizes are between 32 bytes and the whole 4 gigabytes of addressable memory.

The memory protection unit is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

The Cortex-M4F processor is a high performance 32-bit processor designed for the microcontroller market. It offers significant benefits to developers, including:

- Outstanding processing performance combined with fast interrupt handling
- Enhanced system debug with extensive breakpoint and trace capabilities
- Efficient processor core, system and memories
- Ultralow power consumption with integrated sleep modes
- Platform security robustness with optional integrated memory protection unit (MPU)

With its embedded ARM core, the STM32F302xx/STM32F303xx devices are compatible with all ARM development tools and software.

### 3.3 Embedded Flash memory

All STM32F302xx/STM32F303xx devices feature up to 256 Kbytes of embedded Flash memory available for storing programs and data. The Flash memory access time is adjusted to the CPU clock frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above).

### 3.4 Embedded SRAM

STM32F302xx/STM32F303xx devices feature up to 48 Kbytes of embedded SRAM with hardware parity check. The memory can be accessed in read/write at CPU clock speed with 0 wait states, allowing the CPU to achieve 90 Dhrystone Mips at 72 MHz (when running code from CCM, core coupled memory).

- 8 Kbytes of SRAM mapped on the instruction bus (Core Coupled Memory (CCM)), used to execute critical routines or to access data (parity check on all of CCM RAM).
- 40 Kbytes of SRAM mapped on the data bus (parity check on first 16 Kbytes of SRAM).

### 3.5 Boot modes

At startup, Boot0 pin and Boot1 option bit are used to select one of three boot options:

- Boot from user Flash
- Boot from system memory
- Boot from embedded SRAM

The boot loader is located in system memory. It is used to reprogram the Flash memory by using USART1, USART2 or USB(DFU).

### 3.6 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at linktime and stored at a given memory location.

## 3.7 Power management

### 3.7.1 Power supply schemes

- $V_{SS}$ ,  $V_{DD}$  = 2.0 to 3.6 V: external power supply for I/Os and the internal regulator. It is provided externally through  $V_{DD}$  pins
- $V_{SSA}$ ,  $V_{DDA}$  = 2.0 to 3.6 V: external analog power supply for ADC, DACs, comparators, operational amplifiers, reset blocks, RCs and PLL (minimum voltage to be applied to  $V_{DDA}$  is 2.4 V when the DACs and operational amplifiers are used). The  $V_{DDA}$  voltage level must be always greater or equal to the  $V_{DD}$  voltage level and must be provided first.
- $V_{BAT}$  = 1.65 to 3.6 V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when  $V_{DD}$  is not present.

### 3.7.2 Power supply supervisor

The device has an integrated power-on reset (POR) and power-down reset (PDR) circuits. They are always active, and ensure proper operation above a threshold of 2 V. The device remains in reset mode when the monitored supply voltage is below a specified threshold,  $V_{POR}/PDR$ , without the need for an external reset circuit.

- The POR monitors only the  $V_{DD}$  supply voltage. During the startup phase it is required that  $V_{DDA}$  should arrive first and be greater than or equal to  $V_{DD}$ .
- The PDR monitors both the  $V_{DD}$  and  $V_{DDA}$  supply voltages, however the  $V_{DDA}$  power supply supervisor can be disabled (by programming a dedicated Option bit) to reduce the power consumption if the application design ensures that  $V_{DDA}$  is higher than or equal to  $V_{DD}$ .

The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}$  power supply and compares it to the  $V_{PVD}$  threshold. An interrupt can be generated when  $V_{DD}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}$  is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 3.7.3 Voltage regulator

The regulator has three operation modes: main (MR), low power (LPR), and power-down.

- The MR mode is used in the nominal regulation mode (Run)
- The LPR mode is used in Stop mode.
- The power-down mode is used in Standby mode: the regulator output is in high impedance, and the kernel circuitry is powered down thus inducing zero consumption.

The voltage regulator is always enabled after reset. It is disabled in Standby mode.

### 3.7.4 Low-power modes

The STM32F302xx/STM32F303xx supports three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- Sleep mode

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

- Stop mode

Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the 1.8 V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low-power mode.

The device can be woken up from Stop mode by any of the EXTI line. The EXTI line source can be one of the 16 external lines, the PVD output, the USB wakeup on STM32F303xx devices, the RTC alarm, COMPx, I2Cx or U(S)ARTx.

- Standby mode

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.8 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering Standby mode, SRAM and register contents are lost except for registers in the Backup domain and Standby circuitry.

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pin or an RTC alarm occurs.

*Note: The RTC, the IWDG and the corresponding clock sources are not stopped by entering Stop or Standby mode.*

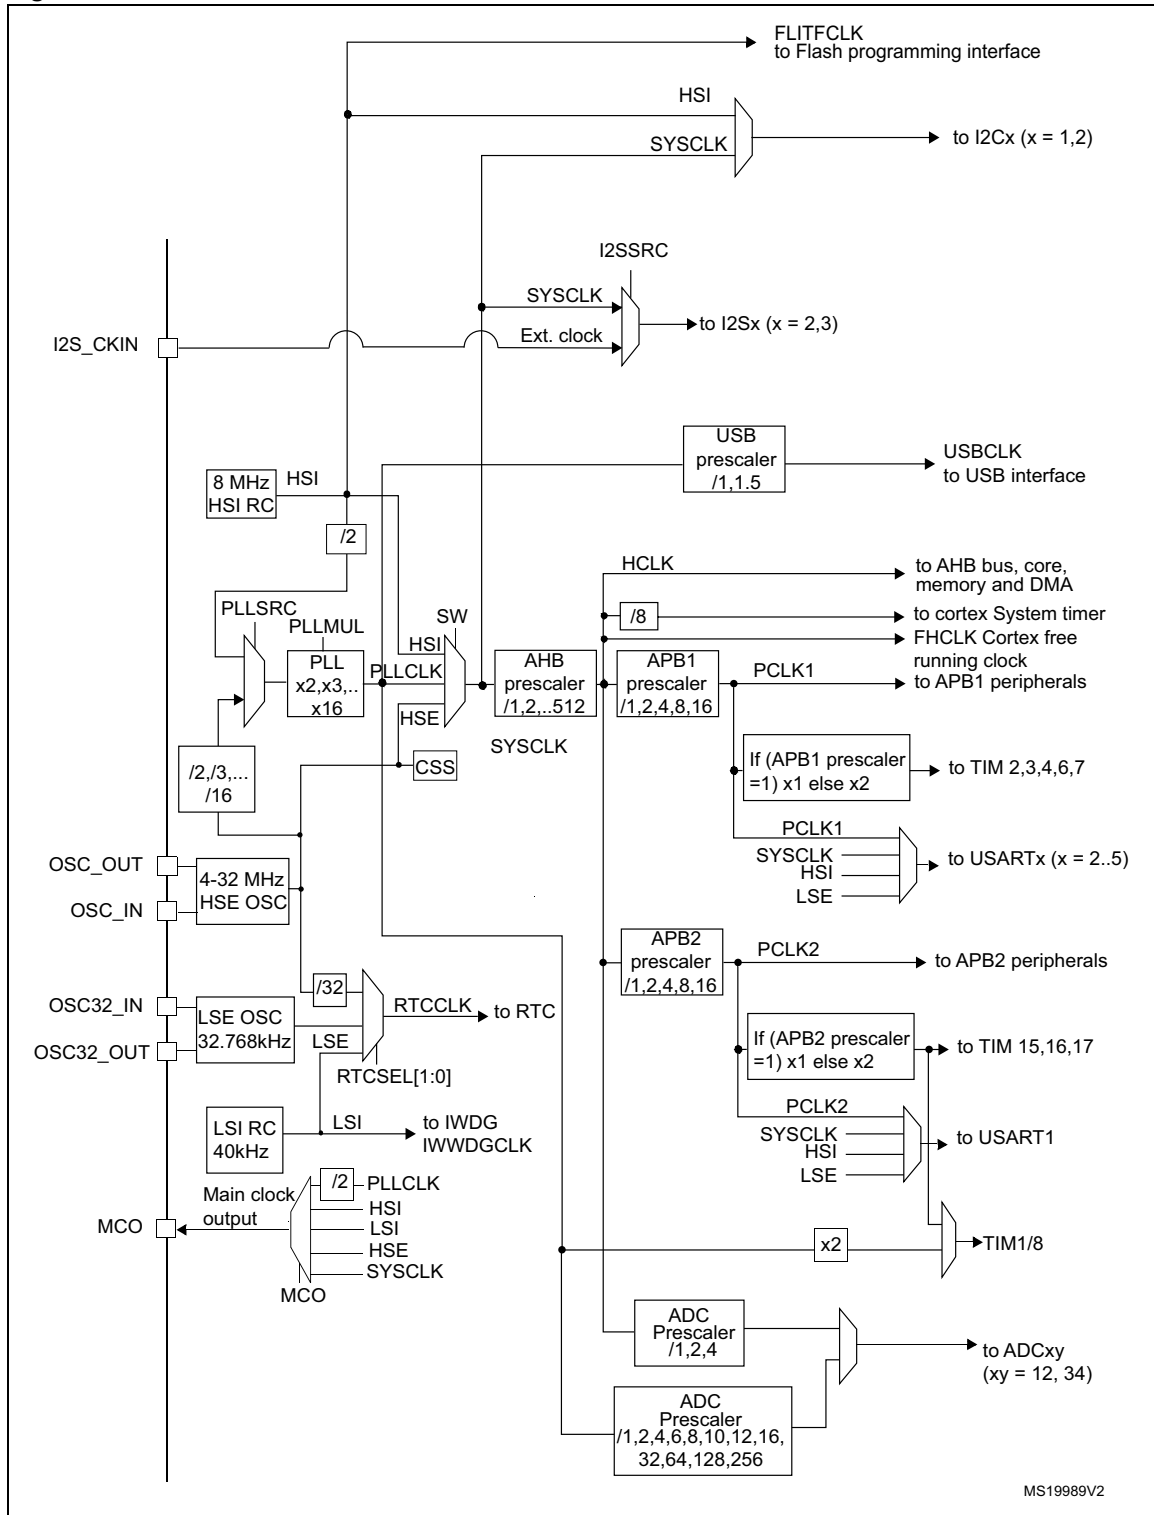

## 3.8 Clocks and startup

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 4-32 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example with failure of an indirectly used external oscillator).

Several prescalers allow to configure the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the high speed APB domains is 72 MHz, while the maximum allowed frequency of the low speed APB domain is 36 MHz.

Figure 3. Clock tree

### 3.9 GPIOs (general-purpose inputs/outputs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high current capable except for analog inputs.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

### 3.10 DMA (direct memory access)

The flexible general-purpose DMA is able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The DMA controller supports circular buffer management, avoiding the generation of interrupts when the controller reaches the end of the buffer.

Each of the 12 DMA channels is connected to dedicated hardware DMA requests, with software trigger support for each channel. Configuration is done by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI, I<sup>2</sup>C, USART, general-purpose timers, DAC and ADC.

### 3.11 Interrupts and events

#### 3.11.1 Nested vectored interrupt controller (NVIC)

The STM32F302xx/STM32F303xx devices embed a nested vectored interrupt controller (NVIC) able to handle up to 66 maskable interrupt channels and 16 priority levels.

The NVIC benefits are the following:

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

The NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

## 3.12 Fast ADC (analog-to-digital converter)

Up to four fast analog-to-digital converters 5 MSPS, with selectable resolution between 12 and 6 bit, are embedded in the STM32F302xx/STM32F303xx family devices. The ADCs have up to 39 external channels. Some of the external channels are shared between ADC1&2 and between ADC3&4, performing conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

The ADCs have also internal channels: Temperature sensor connected to ADC1 channel 16,  $V_{BAT/2}$  connected to ADC1 channel 17, Voltage reference  $V_{REFINT}$  connected to the 4 ADCs channel 18, VOPAMP1 connected to ADC1 channel 15, VOPAMP2 connected to ADC2 channel 17, VOPAMP3 connected to ADC3 channel 17, VOPAMP4 connected to ADC4 channel 17.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Interleaved sample and hold
- Single-shunt phase current reading techniques.

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the general-purpose timers (TIMx) and the advanced-control timers (TIM1 on all devices and TIM8 on STM32F303xx devices) can be internally connected to the ADC start trigger and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

### 3.12.1 Temperature sensor

The temperature sensor (TS) generates a voltage  $V_{SENSE}$  that varies linearly with temperature.

The temperature sensor is internally connected to the ADC\_IN16 input channel which is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode.

**Table 3. Temperature sensor calibration values**

Calibration value name	Description	Memory address
TS_CAL1	TS ADC raw data acquired at temperature of 30 °C, $V_{DDA} = 3.3\text{ V}$	0x1FFF F7B8 - 0x1FFF F7B9
TS_CAL2	TS ADC raw data acquired at temperature of 110 °C $V_{DDA} = 3.3\text{ V}$	0x1FFF F7C2 - 0x1FFF F7C3

### 3.12.2 Internal voltage reference ( $V_{REFINT}$ )

The internal voltage reference ( $V_{REFINT}$ ) provides a stable (bandgap) voltage output for the ADC and Comparators.  $V_{REFINT}$  is internally connected to the ADC\_IN18 input channel. The precise voltage of  $V_{REFINT}$  is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode.

**Table 4. Temperature sensor calibration values**

Calibration value name	Description	Memory address
VREFINT_CAL	Raw data acquired at temperature of 30 °C $V_{DDA} = 3.3\text{ V}$	0x1FFF F7BA - 0x1FFF F7BB

### 3.12.3 $V_{BAT}$ battery voltage monitoring

This embedded hardware feature allows the application to measure the  $V_{BAT}$  battery voltage using the internal ADC channel ADC\_IN17. As the  $V_{BAT}$  voltage may be higher than  $V_{DDA}$ , and thus outside the ADC input range, the  $V_{BAT}$  pin is internally connected to a bridge divider by 2. As a consequence, the converted digital value is half the  $V_{BAT}$  voltage.

### 3.12.4 OPAMP reference voltage (VOPAMP)

Every OPAMP reference voltage can be measured using a corresponding ADC internal channel: VOPAMP1 connected to ADC1 channel 15, VOPAMP2 connected to ADC2 channel 17, VOPAMP3 connected to ADC3 channel 17, VOPAMP4 connected to ADC4 channel 17.

### 3.13 DAC (digital-to-analog converter)

Up to two 12-bit buffered DAC channels can be used to convert digital signals into analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This digital interface supports the following features:

- Up to two DAC output channels on STM32F303xx devices
- 8-bit or 12-bit monotonic output
- Left or right data alignment in 12-bit mode
- Synchronized update capability on STM32F303xx devices
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channel independent or simultaneous conversions on STM32F303xx devices
- DMA capability (for each channel on STM32F303xx devices)
- External triggers for conversion

### 3.14 Operational amplifier

The STM32F302xx/STM32F303xx embeds up to four operational amplifiers with external or internal follower routing and PGA capability (or even amplifier and filter capability with external components). When an operational amplifier is selected, an external ADC channel is used to enable output measurement.

The operational amplifier features:

- 8 MHz GBP
- 0.5 mA output capability
- Rail-to-rail input/output
- In PGA mode, the gain can be programmed to be 2, 4, 8 or 16.

### 3.15 Fast comparators

The STM32F302xx/STM32F303xx devices embed seven fast rail-to-rail comparators with programmable reference voltage (internal or external), hysteresis and speed (low speed for low power) and with selectable output polarity.

The reference voltage can be one of the following:

- External I/O
- DAC output pin
- Internal reference voltage or submultiple (1/4, 1/2, 3/4). Refer to [Table 28: Embedded internal reference voltage on page 60](#) for the value and precision of the internal reference voltage.

All comparators can wake up from STOP mode, generate interrupts and breaks for the timers and can be also combined per pair into a window comparator

### 3.16 Timers and watchdogs

The STM32F302xx/STM32F303xx includes up to two advanced control timers, up to 6 general-purpose timers, two basic timers, two watchdog timers and a SysTick timer. The table below compares the features of the advanced control, general purpose and basic timers.

**Table 5. Timer feature comparison**

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare Channels	Complementary outputs
Advanced	TIM1, TIM8 (on STM32F303xx devices only)	16-bit	Up, Down, Up/Down	Any integer between 1 and 65536	Yes	4	Yes
General-purpose	TIM2	32-bit	Up, Down, Up/Down	Any integer between 1 and 65536	Yes	4	No
General-purpose	TIM3, TIM4	16-bit	Up, Down, Up/Down	Any integer between 1 and 65536	Yes	4	No
General-purpose	TIM15	16-bit	Up	Any integer between 1 and 65536	Yes	2	1
General-purpose	TIM16, TIM17	16-bit	Up	Any integer between 1 and 65536	Yes	1	1
Basic	TIM6, TIM7 (on STM32F303xx devices only)	16-bit	Up	Any integer between 1 and 65536	Yes	0	No

#### 3.16.1 Advanced timers (TIM1, TIM8)

The advanced-control timers (TIM1 on all devices and TIM8 on STM32F303xx devices) can each be seen as a three-phase PWM multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead-times. They can also be seen as complete general-purpose timers. The 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes) with full modulation capability (0-100%)
- One-pulse mode output

In debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled to turn off any power switches driven by these outputs.

Many features are shared with those of the general-purpose TIM timers (described in [Section 3.16.2](#) using the same architecture, so the advanced-control timers can work together with the TIM timers via the Timer Link feature for synchronization or event chaining.

### 3.16.2 General-purpose timers (TIM2, TIM3, TIM4, TIM15, TIM16, TIM17)

There are up to six synchronizable general-purpose timers embedded in the STM32F302xx/STM32F303xx (see [Table 5](#) for differences). Each general-purpose timer can be used to generate PWM outputs, or act as a simple time base.

- TIM2, 3, and TIM4

These are full-featured general-purpose timers:

- TIM2 has a 32-bit auto-reload up/downcounter and 32-bit prescaler
- TIM3 and 4 have 16-bit auto-reload up/downcounters and 16-bit prescalers.

These timers all feature 4 independent channels for input capture/output compare, PWM or one-pulse mode output. They can work together, or with the other general-purpose timers via the Timer Link feature for synchronization or event chaining.

The counters can be frozen in debug mode.

All have independent DMA request generation and support quadrature encoders.

- TIM15, 16 and 17

These three timers general-purpose timers with mid-range features:

They have 16-bit auto-reload upcounters and 16-bit prescalers.

- TIM15 has 2 channels and 1 complementary channel
- TIM16 and TIM17 have 1 channel and 1 complementary channel

All channels can be used for input capture/output compare, PWM or one-pulse mode output.

The timers can work together via the Timer Link feature for synchronization or event chaining. The timers have independent DMA request generation.

The counters can be frozen in debug mode.

### 3.16.3 Basic timers (TIM6, TIM7)

These timers are mainly used for DAC trigger generation. They can also be used as a generic 16-bit time base.

### 3.16.4 Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 40 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

### 3.16.5 Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

### 3.16.6 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0.
- Programmable clock source

## 3.17 Real-time clock (RTC) and backup registers

The RTC and the 16 backup registers are supplied through a switch that takes power from either the  $V_{DD}$  supply when present or the  $V_{BAT}$  pin. The backup registers are sixteen 32-bit registers used to store 64 bytes of user application data when  $V_{DD}$  power is not present.

They are not reset by a system or power reset, or when the device wakes up from Standby mode.

The RTC is an independent BCD timer/counter. It supports the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
- Automatic correction for 28, 29 (leap year), 30 and 31 days of the month.
- Two programmable alarms with wake up from Stop and Standby mode capability.
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
- Digital calibration circuit with 1 ppm resolution, to compensate for quartz crystal inaccuracy.
- Three anti-tamper detection pins with programmable filter. The MCU can be woken up from Stop and Standby modes on tamper event detection.
- Timestamp feature which can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event. The MCU can be woken up from Stop and Standby modes on timestamp event detection.
- 17-bit Auto-reload counter for periodic interrupt with wakeup from STOP/STANDBY capability.

The RTC clock sources can be:

- A 32.768 kHz external crystal
- A resonator or oscillator
- The internal low-power RC oscillator (typical frequency of 40 kHz)
- The high-speed external clock divided by 32.

### 3.18 I<sup>2</sup>C bus

Up to two I<sup>2</sup>C bus interfaces can operate in multimaster and slave modes. They can support standard (up to 100 KHz), fast (up to 400 KHz) and fast mode + (up to 1 MHz) modes.

Both support 7-bit and 10-bit addressing modes, multiple 7-bit slave addresses (2 addresses, 1 with configurable mask). They also include programmable analog and digital noise filters.

**Table 6. Comparison of I2C analog and digital filters**

	Analog filter	Digital filter
Pulse width of suppressed spikes	≥ 50 ns	Programmable length from 1 to 15 I2C peripheral clocks
Benefits	Available in Stop mode	1. Extra filtering capability vs. standard requirements. 2. Stable length
Drawbacks	Variations depending on temperature, voltage, process	Disabled when Wakeup from Stop mode is enabled

In addition, they provide hardware support for SMBUS 2.0 and PMBUS 1.1: ARP capability, Host notify protocol, hardware CRC (PEC) generation/verification, timeouts verifications and ALERT protocol management. They also have a clock domain independent from the CPU clock, allowing the I2Cx (x=1,2) to wake up the MCU from Stop mode on address match.

The I2C interfaces can be served by the DMA controller.

Refer to [Table 7](#) for the features available in I2C1 and I2C2.

**Table 7. STM32F30x I<sup>2</sup>C implementation**

I2C features <sup>(1)</sup>	I2C1	I2C2
7-bit addressing mode	X	X
10-bit addressing mode	X	X
Standard mode (up to 100 kbit/s)	X	X
Fast mode (up to 400 kbit/s)	X	X
Fast Mode Plus with 20mA output drive I/Os (up to 1 Mbit/s)	X	X
Independent clock	X	X
SMBus	X	X
Wakeup from STOP	X	X

1. X = supported.

### 3.19 Universal synchronous/asynchronous receiver transmitter (USART)

The STM32F302xx/STM32F303xx devices have three embedded universal synchronous/asynchronous receiver transmitters (USART1, USART2 and USART3).

The USART interfaces are able to communicate at speeds of up to 9 Mbits/s.

They provide hardware management of the CTS and RTS signals, they support IrDA SIR ENDEC, the multiprocessor communication mode, the single-wire half-duplex communication mode and have LIN Master/Slave capability. The USART interfaces can be served by the DMA controller.

### 3.20 Universal asynchronous receiver transmitter (UART)

The STM32F302xx/STM32F303xx devices have 2 embedded universal asynchronous receiver transmitters (UART4, and UART5). The UART interfaces support IrDA SIR ENDEC, multiprocessor communication mode and single-wire half-duplex communication mode. The UART interfaces can be served by the DMA controller.

Refer to [Table 8](#) for the features available in all U(S)ARTs interfaces

**Table 8. USART features**

USART modes/features <sup>(1)</sup>	USART1	USART2	USART3	USART4	USART5
Hardware flow control for modem	X	X	X		
Continuous communication using DMA	X	X	X	X	X
Multiprocessor communication	X	X	X	X	X
Synchronous mode	X	X	X		
Smartcard mode	X	X	X		
Single-wire half-duplex communication	X	X	X	X	X
IrDA SIR ENDEC block	X	X	X	X	X
LIN mode	X	X	X	X	X
Dual clock domain and wakeup from Stop mode	X	X	X	X	X
Receiver timeout interrupt	X	X	X	X	X
Modbus communication	X	X	X	X	X
Auto baud rate detection	X	X	X		
Driver Enable	X	X	X		

1. X = supported.

### 3.21 Serial peripheral interface (SPI)/Inter-integrated sound interfaces (I2S)

Up to three SPIs are able to communicate up to 18 Mbits/s in slave and master modes in full-duplex and simplex communication modes. The 3-bit prescaler gives 8 master mode frequencies and the frame size is configurable from 4 bits to 16 bits.

Two standard I2S interfaces (multiplexed with SPI2 and SPI3) supporting four different audio standards can operate as master or slave at half-duplex and full duplex communication modes. They can be configured to transfer 16 and 24 or 32 bits with 16-bit or 32-bit data resolution and synchronized by a specific signal. Audio sampling frequency from 8 kHz up to 192 kHz can be set by 8-bit programmable linear prescaler. When operating in master mode it can output a clock for an external audio component at 256 times the sampling frequency.

Refer to [Table 9](#) for the features available in SPI1, SPI2 and SPI3.

**Table 9. STM32F30x SPI/I2S implementation**

SPI features <sup>(1)</sup>	SPI1	SPI2	SPI3
Hardware CRC calculation	X	X	X
Rx/Tx FIFO	X	X	X
NSS pulse mode	X	X	X
I2S mode		X	X
TI mode	X	X	X

1. X = supported.

### 3.22 Controller area network (CAN)

The CAN is compliant with specifications 2.0A and B (active) with a bit rate up to 1 Mbit/s. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. It has three transmit mailboxes, two receive FIFOs with 3 stages and 14 scalable filter banks.

### 3.23 Universal serial bus (USB)

The STM32F302xx/STM32F303xx medium and high density devices embed an USB device peripheral compatible with the USB full-speed 12 Mbs. The USB interface implements a full-speed (12 Mbit/s) function interface. It has software-configurable endpoint setting and suspend/resume support. The dedicated 48 MHz clock is generated from the internal main PLL (the clock source must use a HSE crystal oscillator).

### 3.24 Infrared Transmitter

The STM32F302xx/STM32F303xx devices provide an infrared transmitter solution. The solution is based on internal connections between TIM16 and TIM17 as shown in the figure below.

TIM17 is used to provide the carrier frequency and TIM16 provides the main signal to be sent. The infrared output signal is available on PB9 or PA13.

To generate the infrared remote control signals, TIM16 channel 1 and TIM17 channel 1 must be properly configured to generate correct waveforms. All standard IR pulse modulation modes can be obtained by programming the two timers output compare channels.

**Figure 4. Infrared transmitter**

### 3.25 Touch sensing controller (TSC)

Capacitive sensing technology is able to detect the presence of a finger near an electrode which is protected from direct touch by a dielectric (glass, plastic...). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle. It consists of charging the electrode capacitance and then transferring a part of the accumulated charges into a sampling capacitor until the voltage across this capacitor has reached a specific threshold. To limit the CPU bandwidth usage this acquisition is directly managed by the hardware touch sensing controller and only requires few external components to operate. The STM32F302xx/STM32F303xx devices offer up to 24 capacitive sensing channels distributed over 8 analog I/O groups.

The touch sensing controller is fully supported by the STMTouch touch sensing firmware library which is free to use and allows touch sensing functionality to be implemented reliably in the end application.

**Table 10. Capacitive sensing GPIOs available on STM32F30x devices**

Group	Capacitive sensing signal name	Pin name	Group	Capacitive sensing signal name	Pin name
1	TSC_G1_IO1	PA0	5	TSC_G5_IO1	PB3
	TSC_G1_IO2	PA1		TSC_G5_IO2	PB4
	TSC_G1_IO3	PA2		TSC_G5_IO3	PB6
	TSC_G1_IO4	PA3		TSC_G5_IO4	PB7
2	TSC_G2_IO1	PA4	6	TSC_G6_IO1	PB11
	TSC_G2_IO2	PA5		TSC_G6_IO2	PB12
	TSC_G2_IO3	PA6		TSC_G6_IO3	PB13
	TSC_G2_IO4	PA7		TSC_G6_IO4	PB14

	TSC_G4_IO4	PA14		TSC_G8_IO4	PD15

**Table 11. No. of capacitive sensing channels available on STM32F302xx/STM32F303xx devices**

Analog I/O group	Number of capacitive sensing channels		
	STM32F30xVx	STM32F30xRx	STM32F30xCx
G1	3	3	3
G2	3	3	3
G3	3	3	2
G4	3	3	3
G5	3	3	3
G6	3	3	3
G7	3	0	0
G8	3	0	0
Number of capacitive sensing channels	24	18	17

## 3.26 Development support

### 3.26.1 Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP Interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

The JTAG TMS and TCK pins are shared respectively with SWDIO and SWCLK and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

### 3.26.2 Embedded trace macrocell™

The ARM embedded trace macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F302xx/STM32F303xx through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using a high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer running debugger software. TPA hardware is commercially available from common development tool vendors. It operates with third party debugger software tools.

4 Pinouts and pin description

Figure 5. STM32F302xx/STM32F303xx LQFP48 pinout

Figure 6. STM32F302xx/STM32F303xx LQFP64 pinout

Figure 7. STM32F302xx/STM32F303xx LQFP100 pinout

**Table 12. Legend/abbreviations used in the pinout table**

Name		Abbreviation	Definition
Pin name			Unless otherwise specified in brackets below the pin name, the pin function during and after reset is the same as the actual pin name
Pin type		S	Supply pin
		I	Input only pin
		I/O	Input / output pin
I/O structure		FT	5 V tolerant I/O
		FTf	5 V tolerant I/O, FM+ capable
		TTa	3.3 V tolerant I/O directly connected to ADC
		TC	Standard 3.3V I/O
		B	Dedicated BOOT0 pin
		RST	Bidirectional reset pin with embedded weak pull-up resistor
Notes			Unless otherwise specified by a note, all I/Os are set as floating inputs during and after reset
Pin functions	Alternate functions		Functions selected through GPIOx_AFR registers
	Additional functions		Functions directly selected/enabled through peripheral registers

Table 13. STM32F302xx/STM32F303xx pin definitions

Pin number			Pin name (function after reset)	Pin type	I/O structure	Notes	Pin functions	
LQF P100	LQF P64	LQF P48					Alternate functions	Additional functions
1			PE2	I/O	FT	(1)	TRACECK, TIM3_CH1, TSC_G7_IO1	
2			PE3	I/O	FT	(2)(1)	TRACED0, TIM3_CH2, TSC_G7_IO2	
3			PE4	I/O	FT	(1)	TRACED1, TIM3_CH3, TSC_G7_IO3	
4			PE5	I/O	FT	(1)	TRACED2, TIM3_CH4, TSC_G7_IO4	
5			PE6	I/O	FT	(1)	TRACED3	WKUP3, RTC_TAMP3
6	1	1	V <sub>BAT</sub>	S			Backup power supply	
7	2	2	PC13	I/O	TC		TIM1_CH1N	WKUP2, RTC_TAMP1, RTC_TS, RTC_OUT
8	3	3	PC14 - OSC32_IN (PC14)	I/O	TC			OSC32_IN
9	4	4	PC15- OSC32_ OUT (PC15)	I/O	TC			OSC32_OUT
10			PF9	I/O	FT	(1)	TIM15_CH1, SPI2_SCK	
11			PF10	I/O	FT	(1)	TIM15_CH2, SPI2_SCK	
12	5	5	PF0- OSC_IN (PF0)	I/O	FTf		TIM1_CH3N, I2C2_SDA	OSC_IN
13	6	6	PF1- OSC_OUT (PF1)	I/O	FTf		I2C2_SCL	OSC_OUT
14	7	7	NRST	I/O	RST		Device reset input / internal reset output (active low)	
15	8		PC0	I/O	TTa	(1)		ADC12_IN6, COMP7_INM <sup>(3)</sup>
16	9		PC1	I/O	TTa	(1)		ADC12_IN7, COMP7_INP <sup>(3)</sup>
17	10		PC2	I/O	TTa	(1)	COMP7_OUT <sup>(3)</sup>	ADC12_IN8
18	11		PC3	I/O	TTa	(1)	TIM1_BKIN2	ADC12_IN9
19			PF2	I/O	TTa	(1)		ADC12_IN10
20	12	8	V <sub>SSA</sub> / V <sub>REF-</sub>	S			Analog ground/Negative reference voltage	
21			V <sub>REF+</sub>	S		(1)	Positive reference voltage	
22			V <sub>DDA</sub>	S		(1)	Analog power supply	
	13	9	V <sub>DDA</sub> , V <sub>REF+</sub>	S			Analog power supply/Positive reference voltage	

Table 13. STM32F302xx/STM32F303xx pin definitions (continued)

Pin number			Pin name (function after reset)	Pin type	I/O structure	Notes	Pin functions	
LQF P100	LQF P64	LQF P48					Alternate functions	Additional functions
23	14	10	PA0	I/O	TTa		USART2_CTS, TIM2_CH1_ETR, TIM8_BKIN <sup>(3)</sup> , TIM8_ETR <sup>(3)</sup> , TSC_G1_IO1, COMP1_OUT	ADC1_IN1, COMP1_INM, RTC_TAMP2, WKUP1, COMP7_INP <sup>(3)</sup>
24	15	11	PA1	I/O	TTa		USART2_RTS, TIM2_CH2, TSC_G1_IO2, TIM15_CH1N <sup>(3)</sup>	ADC1_IN2, COMP1_INP, OPAMP1_VINP, OPAMP3_VINP <sup>(3)</sup>
25	16	12	PA2	I/O	TTa		USART2_TX, TIM2_CH3, TIM15_CH1, TSC_G1_IO3, COMP2_OUT	ADC1_IN3, COMP2_INM, AOP1_OUT
26	17	13	PA3	I/O	TTa		USART2_RX, TIM2_CH4, TIM15_CH2, TSC_G1_IO4,	ADC1_IN4, OPAMP1_VINP, COMP2_INP, OPAMP1_VINM
27	18		PF4	I/O	TTa	(1)	COMP1_OUT	ADC1_IN5
28	19		VDD_4	S		(1)		
29	20	14	PA4	I/O	TTa		SPI1_NSS, SPI3_NSS/I2S3_WS <sup>(3)</sup> , USART2_CK, TSC_G2_IO1, TIM3_CH2	ADC2_IN1, DAC1_OUT1, OPAMP4_VINP, COMP1_INM4, COMP2_INM4, COMP3_INM4, COMP4_INM4, COMP5_INM4, COMP6_INM4, COMP7_INM4
30	21	15	PA5	I/O	TTa		SPI1_SCK, TIM2_CH1_ETR, TSC_G2_IO2	ADC2_IN2, DAC1_OUT2 <sup>(3)</sup> , OPAMP1_VINP, OPAMP2_VINM, OPAMP3_VINP, COMP1_INM5, COMP2_INM5, COMP3_INM5, COMP4_INM5, COMP5_INM5, COMP6_INM5, COMP7_INM5
31	22	16	PA6	I/O	TTa		SPI1_MISO, TIM3_CH1, TIM8_BKIN <sup>(3)</sup> , TIM1_BKIN, TIM16_CH1, COMP1_OUT, TSC_G2_IO3	ADC2_IN3, AOP2_OUT
32	23	17	PA7	I/O	TTa		SPI1_MOSI, TIM3_CH2, TIM17_CH1, TIM1_CH1N, TIM8_CH1N, TSC_G2_IO4, COMP2_OUT	ADC2_IN4, COMP2_IN, OPAMP2_VINP, OPAMP1_VINP
33	24		PC4	I/O	TTa	(1)	USART1_TX	ADC2_IN5

100	64	48	VDD_1	S			Digital power supply	

1. When using the small packages (48 and 64 pin packages), the GPIO pins which are not present on these packages, must not be configured in analog mode.
2. Function availability depends on the chosen device.
3. On STM32F303xx devices only.

Table 14. Alternate functions for port A

AF n°	Port & Pin Name	AF0	AF1	AF2	AF3	AF4	AF5	AF6	AF7	AF8	AF9	AF10	AF11	AF12	AF13	AF14	AF15

## 6 Electrical characteristics

### 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

#### 6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ }^{\circ}\text{C}$  and  $T_A = T_{A\text{max}}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ( $\text{mean} \pm 3\Sigma$ ).

#### 6.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = V_{DDA} = 3.3\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ( $\text{mean} \pm 2\Sigma$ ).

#### 6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 9](#).

#### 6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 10](#).

**Figure 9. Pin loading conditions**

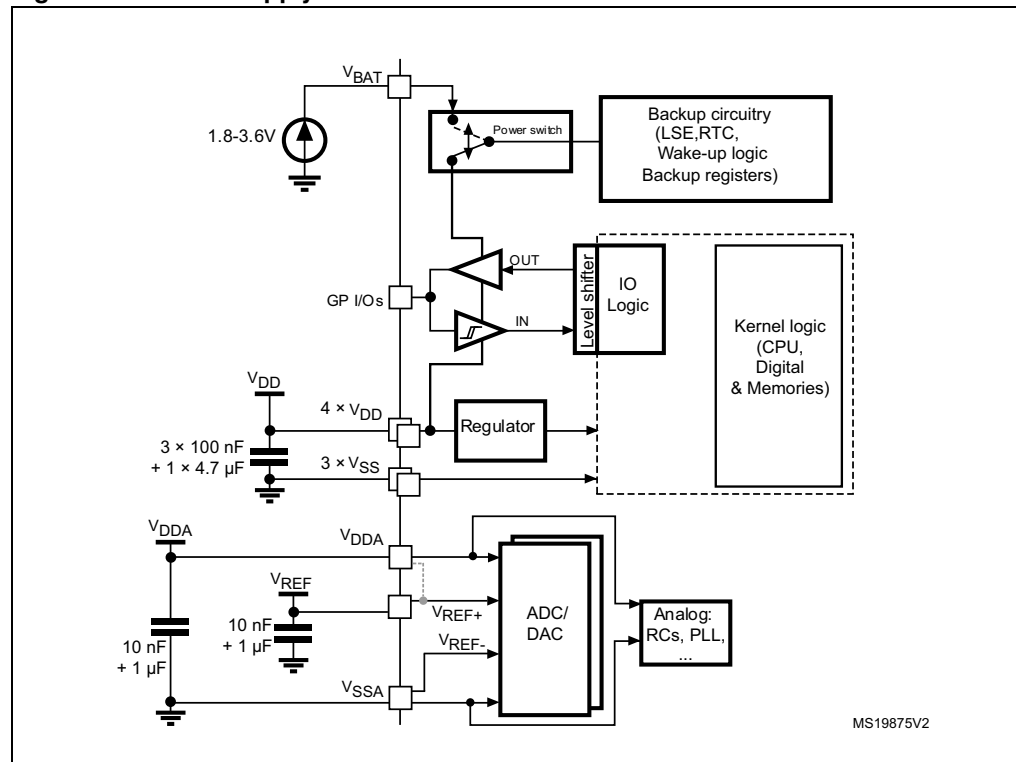

**Figure 10. Pin input voltage**

### 6.1.6 Power supply scheme

**Figure 11. Power supply scheme**

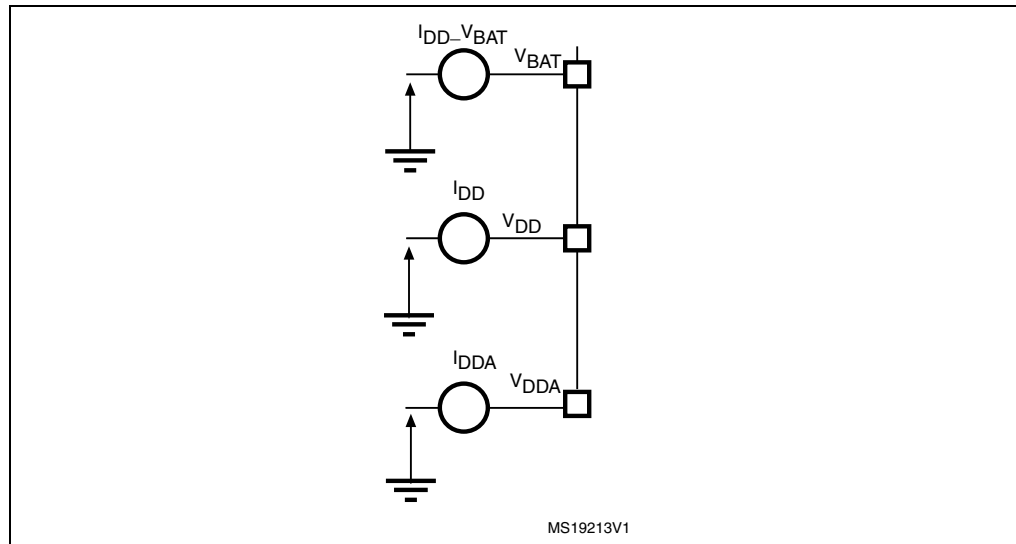

1. Dotted lines represent the internal connections on low pin count packages, joining the dedicated supply pins.

**Caution:** Each power supply pair ( $V_{DD}/V_{SS}$ ,  $V_{DDA}/V_{SSA}$  etc..) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

### 6.1.7 Current consumption measurement

Figure 12. Current consumption measurement scheme

## 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 21: Voltage characteristics](#), [Table 22: Current characteristics](#), and [Table 23: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 21. Voltage characteristics<sup>(1)</sup>**

Symbol	Ratings	Min	Max	Unit
$V_{DD}-V_{SS}$	External main supply voltage (including $V_{DDA}$ , $V_{BAT}$ and $V_{DD}$ )	-0.3	4.0	V
$V_{DD}-V_{DDA}$	Allowed voltage difference for $V_{DD} > V_{DDA}$		0.4	
$V_{IN}^{(2)}$	Input voltage on FT and FTf pins	$V_{SS} - 0.3$	$V_{DD} + 4.0$	
	Input voltage on TTa pins	$V_{SS} - 0.3$	4.0	
	Input voltage on any other pin	$V_{SS} - 0.3$	4.0	
$ \Delta V_{DDx} $	Variations between different $V_{DD}$ power pins		50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins		50	
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	see <a href="#">Section 6.3.11: Electrical sensitivity characteristics</a>		

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 22: Current characteristics](#) for the maximum allowed injected current values.

**Table 22. Current characteristics<sup>(1)</sup>**

Symbol	Ratings	Max.	Unit
$I_{VDD}$	Total current into $V_{DD}$ and $VDDSDx$ power lines (source) <sup>(2)</sup>	TBD	mA
$I_{VSS}$	Total current out of $V_{SS}$ and $VSSSD$ ground lines (sink) <sup>(2)</sup>	TBD	
$I_{IO(PIN)}$	Output current sunk by any I/O and control pin	25	
	Output current source by any I/O and control pin	-25	
$\Sigma I_{IO(PIN)}$	Total output current sunk by sum of all IOs and control pins	75	
	Total output current sourced by sum of all IOs and control pins	75	
$I_{INJ(PIN)}$	Injected current on FT, FTf and B pins <sup>(3)</sup>	-5/+0	
	Injected current on TC and RST pin <sup>(4)</sup>	$\pm 5$	
	Injected current on TTa pins <sup>(5)</sup>	$\pm 5$	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) <sup>(6)</sup>	$\pm 25$	

1. TBD stands for "to be defined".

2. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $VSSSD$  and  $VSSA$ ) pins must always be connected to the external power supply, in the permitted range.

3. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.

4. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 21: Voltage characteristics](#) for the maximum allowed input voltage values.

5. A positive injection is induced by  $V_{IN} > V_{DDA}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer also to [Table 21: Voltage characteristics](#) for the maximum allowed input voltage values. Negative injection disturbs the analog performance of the device. See note <sup>(2)</sup> below [Table 67](#).

6. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

**Table 23. Thermal characteristics**

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	-65 to +150	°C
$T_J$	Maximum junction temperature	150	°C

## 6.3 Operating conditions

### 6.3.1 General operating conditions

**Table 24. General operating conditions<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Max	Unit
f <sub>HCLK</sub>	Internal AHB clock frequency		0	72	MHz
f <sub>PCLK1</sub>	Internal APB1 clock frequency		0	36	
f <sub>PCLK2</sub>	Internal APB2 clock frequency		0	72	
V <sub>DD</sub>	Standard operating voltage		2	3.6	V
V <sub>DDA</sub>	Analog operating voltage (OPAMP and DAC not used)	Must have a potential equal to or higher than V <sub>DD</sub>	2	3.6	V
	Analog operating voltage (OPAMP and DAC used)		2.4	3.6	
V <sub>BAT</sub>	Backup operating voltage		1.65	3.6	V
P <sub>D</sub>	Power dissipation at T <sub>A</sub> = 85 °C for suffix 6 or T <sub>A</sub> = 105 °C for suffix 7 <sup>(2)</sup>	LQFP100		TBD	mW
		LQFP64		TBD	
		LQFP48		TBD	
T <sub>A</sub>	Ambient temperature for 6 suffix version	Maximum power dissipation	–40	85	°C
		Low power dissipation <sup>(3)</sup>	–40	105	
	Ambient temperature for 7 suffix version	Maximum power dissipation	–40	105	°C
		Low power dissipation <sup>(3)</sup>	–40	125	
T <sub>J</sub>	Junction temperature range	6 suffix version	–40	105	°C
		7 suffix version	–40	125	

1. TBD stands for “to be defined”.

2. If T<sub>A</sub> is lower, higher P<sub>D</sub> values are allowed as long as T<sub>J</sub> does not exceed T<sub>Jmax</sub> (see [Table 23: Thermal characteristics](#)).

3. In low power dissipation state, T<sub>A</sub> can be extended to this range as long as T<sub>J</sub> does not exceed T<sub>Jmax</sub> (see [Table 23: Thermal characteristics](#)).

### 6.3.2 Operating conditions at power-up / power-down

The parameters given in [Table 25](#) are derived from tests performed under the ambient temperature condition summarized in [Table 24](#).

**Table 25. Operating conditions at power-up / power-down**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{VDD}$	$V_{DD}$ rise time rate		0	$\infty$	$\mu\text{s/V}$
	$V_{DD}$ fall time rate		20	$\infty$	
$t_{VDDA}$	$V_{DDA}$ rise time rate		0	$\infty$	
	$V_{DDA}$ fall time rate		20	$\infty$	

### 6.3.3 Embedded reset and power control block characteristics

The parameters given in [Table 26](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 24](#).

**Table 26. Embedded reset and power control block characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{POR/PDR}^{(1)}$	Power on/power down reset threshold	Falling edge	1.8 <sup>(2)</sup>	1.88	1.96	V
		Rising edge	1.84	1.92	2.0	V
$V_{PDRhyst}^{(1)}$	PDR hysteresis			40		mV
$t_{RSTTEMPO}^{(3)}$	Reset temporization		1.5	2.5	4.5	ms

1. The PDR detector monitors  $V_{DD}$  and also  $V_{DDA}$  (if kept enabled in the option bytes). The POR detector monitors only  $V_{DD}$ .
2. The product behavior is guaranteed by design down to the minimum  $V_{POR/PDR}$  value.
3. Guaranteed by design, not tested in production

**Table 27. Programmable voltage detector characteristics**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit
$V_{PVD0}$	PVD threshold 0	Rising edge	2.1	2.18	2.26	V
		Falling edge	2	2.08	2.16	V
$V_{PVD1}$	PVD threshold 1	Rising edge	2.19	2.28	2.37	V
		Falling edge	2.09	2.18	2.27	V
$V_{PVD2}$	PVD threshold 2	Rising edge	2.28	2.38	2.48	V
		Falling edge	2.18	2.28	2.38	V
$V_{PVD3}$	PVD threshold 3	Rising edge	2.38	2.48	2.58	V
		Falling edge	2.28	2.38	2.48	V
$V_{PVD4}$	PVD threshold 4	Rising edge	2.47	2.58	2.69	V
		Falling edge	2.37	2.48	2.59	V

**Table 27. Programmable voltage detector characteristics (continued)**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit
V <sub>PVD5</sub>	PVD threshold 5	Rising edge	2.57	2.68	2.79	V
		Falling edge	2.47	2.58	2.69	V
V <sub>PVD6</sub>	PVD threshold 6	Rising edge	2.66	2.78	2.9	V
		Falling edge	2.56	2.68	2.8	V
V <sub>PVD7</sub>	PVD threshold 7	Rising edge	2.76	2.88	3	V
		Falling edge	2.66	2.78	2.9	V
V <sub>PVDhyst</sub> <sup>(2)</sup>	PVD hysteresis			100		mV
IDD(PVD)	PVD current consumption			0.15	0.26	μA

1. Data based on characterization results only, not tested in production.

2. Guaranteed by design, not tested in production.

### 6.3.4 Embedded reference voltage

The parameters given in [Table 28](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 24](#).

**Table 28. Embedded internal reference voltage**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{REFINT}$	Internal reference voltage	$-40\text{ }^{\circ}\text{C} < T_A < +105\text{ }^{\circ}\text{C}$	1.16	1.2	1.25	V
		$-40\text{ }^{\circ}\text{C} < T_A < +85\text{ }^{\circ}\text{C}$	1.16	1.2	1.24 <sup>(1)</sup>	V
$T_{S\_vrefint}$	ADC sampling time when reading the internal reference voltage		2.2	-	-	$\mu\text{s}$
$V_{RERINT}$	Internal reference voltage spread over the temperature range	$V_{DD} = 3\text{ V} \pm 10\text{ mV}$			10 <sup>(2)</sup>	mV
$T_{Coeff}$	Temperature coefficient				100 <sup>(2)</sup>	ppm/ $^{\circ}\text{C}$

1. Data based on characterization results, not tested in production.

2. Guaranteed by design, not tested in production

### 6.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 12: Current consumption measurement scheme](#).

All Run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to CoreMark code.

#### Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load)
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted to the  $f_{HCLK}$  frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states from 48 to 72 MHz)
- Prefetch in ON (reminder: this bit must be set before clock setting and bus prescaling)
- When the peripherals are enabled  $f_{PCLK2} = f_{HCLK}$  and  $f_{PCLK1} = f_{HCLK}/2$

The parameters given in [Table 29](#) to [Table 33](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 24](#).

Table 29. Typical and maximum current consumption from  $V_{DD}$  supply at  $V_{DD} = 3.6$  V

Symbol	Parameter	Conditions	f <sub>HCLK</sub>	All peripherals enabled				All peripherals disabled				Unit	
				Typ	Max @ T <sub>A</sub> <sup>(1)</sup>			Typ	Max @ T <sub>A</sub> <sup>(1)</sup>				
					25 °C	85 °C	105 °C		25 °C	85 °C	105 °C		
I <sub>DD</sub>	Supply current in Run mode, executing from Flash	External clock (HSE bypass)	72 MHz	TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD	mA

### Typical current consumption

The MCU is placed under the following conditions:

- V<sub>DD</sub> = V<sub>DDA</sub> = 3.3 V
- All I/O pins are in analog input configuration
- The Flash access time is adjusted to f<sub>HCLK</sub> frequency (0 wait states from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states from 48 MHz to 72 MHz)
- Prefetch is ON when the peripherals are enabled, otherwise it is OFF
- When the peripherals are enabled, f<sub>APB1</sub> = f<sub>AHB</sub>/2, f<sub>APB2</sub> = f<sub>AHB</sub>
- PLL is used for frequencies greater than 8 MHz
- AHB prescaler of 2, 4, 8 and 16 is used for the frequencies 4 MHz, 2 MHz, 1 MHz and 500 kHz respectively

## I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

### I/O static current consumption

All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in [Table 51: I/O static characteristics](#).

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

**Caution:** Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

### I/O dynamic current consumption

In addition to the internal peripheral current consumption measured previously, the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the MCU supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DD} \times f_{SW} \times C$$

where

$I_{SW}$  is the current sunk by a switching I/O to charge/discharge the capacitive load

$V_{DD}$  is the MCU supply voltage

$f_{SW}$  is the I/O switching frequency

$C$  is the total capacitance seen by the I/O pin:  $C = C_{INT} + C_{EXT}$

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

### On-chip peripheral current consumption

The MCU is placed under the following conditions:

- all I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load)
- all peripherals are disabled unless otherwise mentioned
- the given value is calculated by measuring the current consumption
  - with all peripherals clocked off
  - with only one peripheral clocked on
- ambient operating temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 21](#)

## 6.3.6 External clock source characteristics

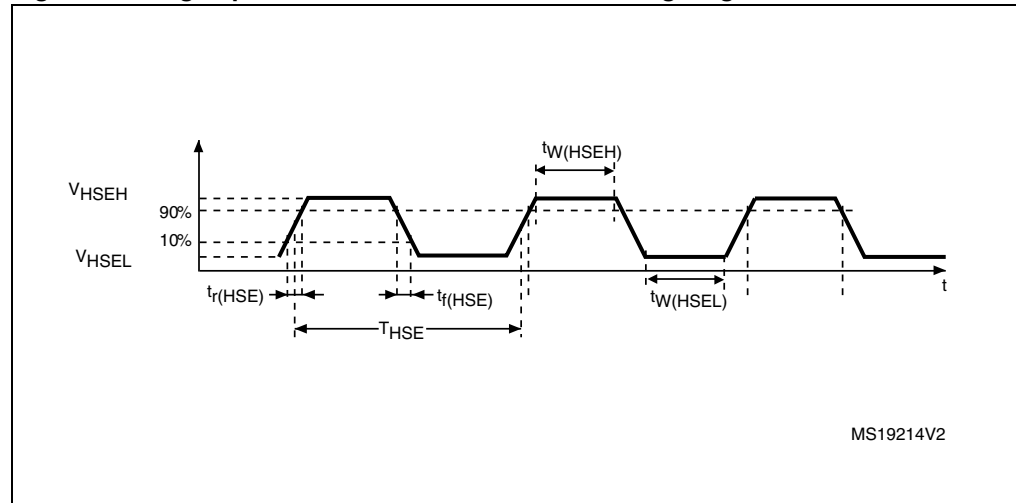

### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO. The external clock signal has to respect the I/O characteristics in [Section 6.3.13](#). However, the recommended clock input waveform is shown in [Figure 13](#).

**Table 36. High-speed external user clock characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE\_ext}$	User external clock source frequency <sup>(1)</sup>		1	8	32	MHz
$V_{HSEH}$	OSC_IN input pin high level voltage		$0.7V_{DD}$		$V_{DD}$	V
$V_{HSEL}$	OSC_IN input pin low level voltage		$V_{SS}$		$0.3V_{DD}$	
$t_{w(HSEH)}$ $t_{w(HSEL)}$	OSC_IN high or low time <sup>(1)</sup>		15			ns
$t_{r(HSE)}$ $t_{f(HSE)}$	OSC_IN rise or fall time <sup>(1)</sup>				20	

1. Guaranteed by design, not tested in production.

**Figure 13. High-speed external clock source AC timing diagram**

### Low-speed external user clock generated from an external source

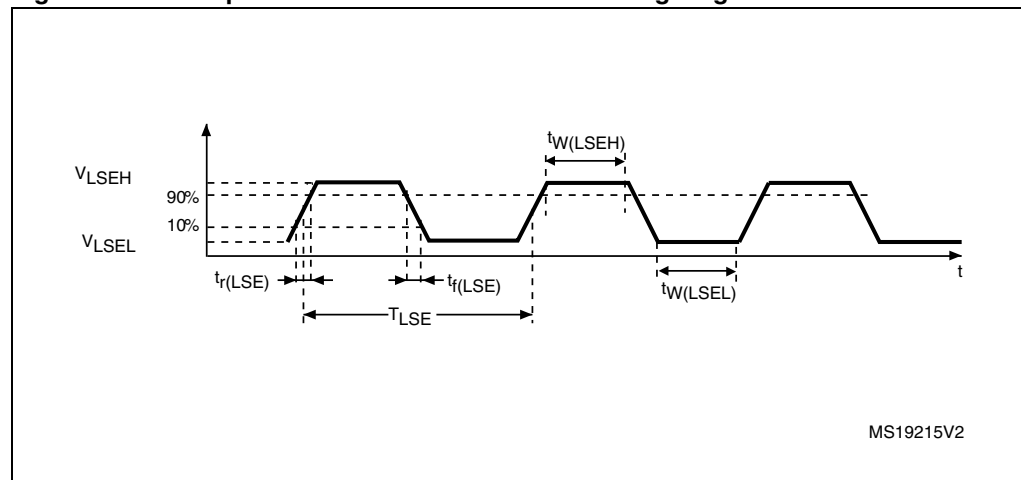

In bypass mode the LSE oscillator is switched off and the input pin is a standard GPIO. The external clock signal has to respect the I/O characteristics in [Section 6.3.13](#). However, the recommended clock input waveform is shown in [Figure 14](#)

**Table 37. Low-speed external user clock characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User External clock source frequency <sup>(1)</sup>			32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage		$0.7V_{DD}$		$V_{DD}$	V
$V_{LSEL}$	OSC32_IN input pin low level voltage		$V_{SS}$		$0.3V_{DD}$	
$t_{w(LSEH)}$ $t_{w(LSEL)}$	OSC32_IN high or low time <sup>(1)</sup>		450			ns
$t_{r(LSE)}$ $t_{f(LSE)}$	OSC32_IN rise or fall time <sup>(1)</sup>				50	

1. Guaranteed by design, not tested in production.

**Figure 14. Low-speed external clock source AC timing diagram**

### High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 32 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in [Table 38](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 38. HSE oscillator characteristics**

Symbol	Parameter	Conditions <sup>(1)</sup>	Min <sup>(2)</sup>	Typ	Max <sup>(2)</sup>	Unit
$f_{OSC\_IN}$	Oscillator frequency		4	8	32	MHz
$R_F$	Feedback resistor			200		k $\Omega$
$I_{DD}$	HSE current consumption	During startup <sup>(3)</sup>			8.5	mA
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@8\text{ MHz}$		0.4		
		$V_{DD}=3.3\text{ V}$ , $R_m=45\Omega$ , $CL=10\text{ pF}@8\text{ MHz}$		0.5		
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@32\text{ MHz}$		0.8		
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@32\text{ MHz}$		1		
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@32\text{ MHz}$		1.5		
$g_m$	Oscillator transconductance	Startup	10			mA/V
$t_{SU(HSE)}^{(4)}$	Startup time	$V_{DD}$ is stabilized		2		ms

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.

2. Guaranteed by design, not tested in production.

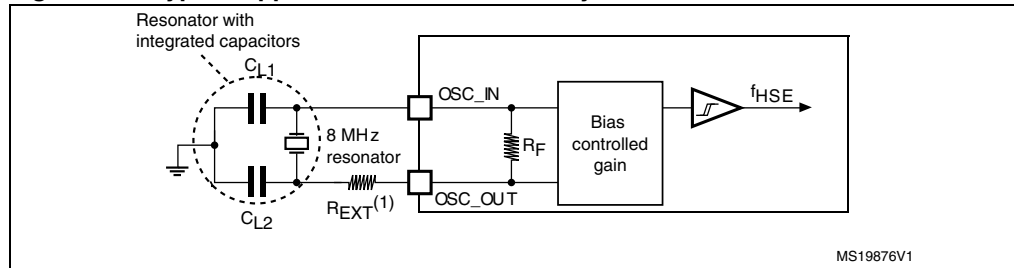

3. This consumption level occurs during the first 2/3 of the  $t_{SU(HSE)}$  startup time

4.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 15](#)).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ .

**Note:** For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website [www.st.com](http://www.st.com).

**Figure 15. Typical application with an 8 MHz crystal**

1.  $R_{EXT}$  value depends on the crystal characteristics.

**Low-speed external clock generated from a crystal/ceramic resonator**

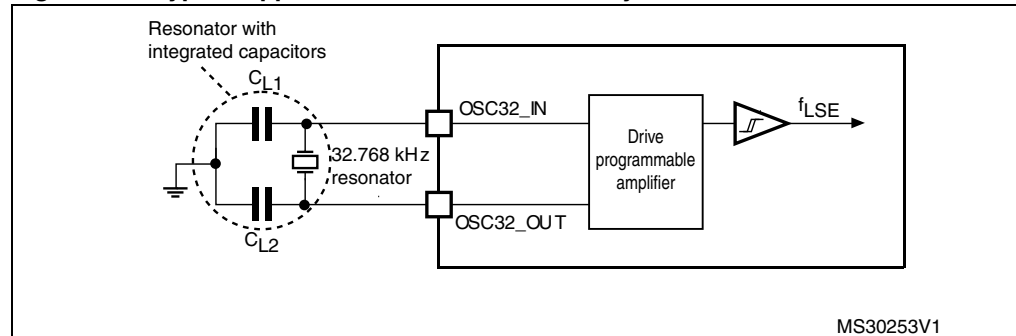

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in [Table 39](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 39. LSE oscillator characteristics ( $f_{LSE} = 32.768$  kHz)**

Symbol	Parameter	Conditions <sup>(1)</sup>	Min <sup>(2)</sup>	Typ	Max <sup>(2)</sup>	Unit
$I_{DD}$	LSE current consumption	LSEDRV[1:0]=00 lower driving capability		0.5	0.9	$\mu A$
		LSEDRV[1:0]=01 medium low driving capability			1	
		LSEDRV[1:0]=10 medium high driving capability			1.3	
		LSEDRV[1:0]=11 higher driving capability			1.6	
$g_m$	Oscillator transconductance	LSEDRV[1:0]=00 lower driving capability	5			$\mu A/V$
		LSEDRV[1:0]=01 medium low driving capability	8			
		LSEDRV[1:0]=10 medium high driving capability	15			
		LSEDRV[1:0]=11 higher driving capability	25			
$t_{SU(LSE)}^{(3)}$	Startup time	$V_{DD}$ is stabilized		2		s

1. Refer to the note and caution paragraphs below the table, and to the application note AN2867 "Oscillator design guide for ST microcontrollers".
2. Guaranteed by design, not tested in production.
3.  $t_{SU(LSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer

**Note:** For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website [www.st.com](http://www.st.com).

**Figure 16. Typical application with a 32.768 kHz crystal**

**Note:** An external resistor is not required between OSC32\_IN and OSC32\_OUT and it is forbidden to add one.

### 6.3.7 Internal clock source characteristics

The parameters given in [Table 40](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 24](#).

#### High-speed internal (HSI) RC oscillator

**Table 40. HSI oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>HSI</sub>	Frequency		-	8		MHz
TRIM	HSI user trimming step		-	-	1 <sup>(2)</sup>	%
DuCy <sub>(HSI)</sub>	Duty cycle		45 <sup>(2)</sup>	-	55 <sup>(2)</sup>	%
ACC <sub>HSI</sub>	Accuracy of the HSI oscillator (factory calibrated)	T <sub>A</sub> = -40 to 105 °C	-3.8 <sup>(3)</sup>	-	4.6 <sup>(3)</sup>	%
		T <sub>A</sub> = -10 to 85 °C	-2.9 <sup>(3)</sup>	-	2.9 <sup>(3)</sup>	%
		T <sub>A</sub> = 0 to 70 °C	-1.3 <sup>(3)</sup>	-	2.2 <sup>(3)</sup>	%
		T <sub>A</sub> = 25 °C	-1	-	1	%
t <sub>su(HSI)</sub>	HSI oscillator startup time		1 <sup>(2)</sup>	-	2 <sup>(2)</sup>	μs
I <sub>DD(HSI)</sub>	HSI oscillator power consumption		-	80	100 <sup>(3)</sup>	μA

1. V<sub>DDA</sub> = 3.3 V, T<sub>A</sub> = -40 to 105 °C unless otherwise specified.

2. Guaranteed by design, not tested in production.

3. Data based on characterization results, not tested in production.

**Low-speed internal (LSI) RC oscillator****Table 41. LSI oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Typ	Max	Unit
$f_{LSI}$	Frequency	30	40	50	kHz
$t_{su(LSI)}^{(2)}$	LSI oscillator startup time			85	$\mu$ s
$I_{DD(LSI)}^{(2)}$	LSI oscillator power consumption		0.75	1.2	$\mu$ A

1.  $V_{DDA} = 3.3$  V,  $T_A = -40$  to  $105$  °C unless otherwise specified.

2. Guaranteed by design, not tested in production.

**Wakeup time from low-power mode**

The wakeup times given in [Table 42](#) are measured on a wakeup phase with a 8-MHz HSI RC oscillator. The event used to wake up the device depends from the current operating mode:

- Stop or sleep mode: the wakeup event is WFE
- The wakeup pin used in stop and sleep mode is PA0 and in standby mode is the PA1.

All timings are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 24](#).

**Table 42. Low-power mode wakeup timings**

Symbol	Parameter	Conditions	Typ @V <sub>DD</sub>					Max	Unit
			= 2.0 V	= 2.4 V	= 2.7 V	= 3 V	= 3.3 V		
$t_{WUSTOP}$	Wakeup from Stop mode	Regulator in run mode	TBD	TBD	TBD	TBD	TBD	TBD	$\mu$ s
		Regulator in low power mode	TBD	TBD	TBD	TBD	TBD	TBD	
$t_{WUSTANDBY}$	Wakeup from Standby mode		TBD	61	57	54	52	TBD	
$t_{WUSLEEP}$	Wakeup from Sleep mode		TBD	TBD	TBD	TBD	TBD	TBD	

### 6.3.8 PLL characteristics

The parameters given in [Table 43](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 24](#).

**Table 43. PLL characteristics**

Symbol	Parameter	Value			Unit
		Min	Typ	Max	
$f_{\text{PLL\_IN}}$	PLL input clock <sup>(1)</sup>	1 <sup>(2)</sup>		24 <sup>(2)</sup>	MHz
	PLL input clock duty cycle	40 <sup>(2)</sup>		60 <sup>(2)</sup>	%
$f_{\text{PLL\_OUT}}$	PLL multiplier output clock	16 <sup>(2)</sup>		72	MHz
$t_{\text{LOCK}}$	PLL lock time			200 <sup>(2)</sup>	μs
Jitter	Cycle-to-cycle jitter			300 <sup>(2)</sup>	ps

1. Take care of using the appropriate multiplier factors so as to have PLL input clock values compatible with the range defined by  $f_{\text{PLL\_OUT}}$ .
2. Guaranteed by design, not tested in production.

### 6.3.9 Memory characteristics

#### Flash memory

The characteristics are given at  $T_A = -40$  to  $105\text{ }^{\circ}\text{C}$  unless otherwise specified.

**Table 44. Flash memory characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max <sup>(1)</sup>	Unit
$t_{\text{prog}}$	16-bit programming time	$T_A = -40$ to $+105\text{ }^{\circ}\text{C}$	40	53.5	60	$\mu\text{s}$
$t_{\text{ERASE}}$	Page (1 KB) erase time	$T_A = -40$ to $+105\text{ }^{\circ}\text{C}$	20	-	40	ms
$t_{\text{ME}}$	Mass erase time	$T_A = -40$ to $+105\text{ }^{\circ}\text{C}$	20	-	40	ms
$I_{\text{DD}}$	Supply current	Write mode	-	-	10	mA
		Erase mode	-	-	12	mA

1. Guaranteed by design, not tested in production.

**Table 45. Flash memory endurance and data retention**

Symbol	Parameter	Conditions	Value	Unit
			Min <sup>(1)</sup>	
$N_{\text{END}}$	Endurance	$T_A = -40$ to $+85\text{ }^{\circ}\text{C}$ (6 suffix versions) $T_A = -40$ to $+105\text{ }^{\circ}\text{C}$ (7 suffix versions)	10	kcycles
$t_{\text{RET}}$	Data retention	1 kcycle <sup>(2)</sup> at $T_A = 85\text{ }^{\circ}\text{C}$	30	Years
		1 kcycle <sup>(2)</sup> at $T_A = 105\text{ }^{\circ}\text{C}$	10	
		10 kcycles <sup>(2)</sup> at $T_A = 55\text{ }^{\circ}\text{C}$	20	

1. Data based on characterization results, not tested in production.

2. Cycling performed over the whole temperature range.

### 6.3.10 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB: A Burst of Fast Transient voltage** (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 46](#). They are based on the EMS levels and classes defined in application note AN1709.

**Table 46. EMS characteristics**

Symbol	Parameter	Conditions	Level/Class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , LQFP100, $T_A = +25\text{ }^{\circ}\text{C}$ , $f_{HCLK} = 72\text{ MHz}$ conforms to IEC 61000-4-2	TBD
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , LQFP100, $T_A = +25\text{ }^{\circ}\text{C}$ , $f_{HCLK} = 72\text{ MHz}$ conforms to IEC 61000-4-4	TBD

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

**Table 47. EMI characteristics**

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. $[f_{HSE}/f_{HCLK}]$	Unit
				8/72 MHz	
$S_{EMI}$	Peak level	$V_{DD} = 3.3\text{ V}$ , $T_A = 25\text{ }^{\circ}\text{C}$ , LQFP100 package compliant with IEC 61967-2	0.1 to 30 MHz	TBD	dBμV
			30 to 130 MHz	TBD	
			130 MHz to 1GHz	TBD	
			SAE EMI Level	TBD	-

## 6.3.11 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts  $\times$  (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

**Table 48. ESD absolute maximum ratings<sup>(1)</sup>**

Symbol	Ratings	Conditions	Class	Maximum value <sup>(2)</sup>	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	$T_A = +25\text{ }^{\circ}\text{C}$ , conforming to JESD22-A114	2	TBD	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	$T_A = +25\text{ }^{\circ}\text{C}$ , conforming to JESD22-C101	II	TBD	

1. TBD stands for "to be defined".

2. Data based on characterization results, not tested in production.

### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

**Table 49. Electrical sensitivities**

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	$T_A = +105\text{ }^{\circ}\text{C}$ conforming to JESD78A	II level A

### 6.3.12 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard, 3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit ( $>5$  LSB TUE), out of spec current injection on adjacent pins or other functional failure (for example reset, oscillator frequency deviation).

The test results are given in [Table 50](#)

Table 50. I/O current injection susceptibility

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I <sub>INJ</sub>	Injected current on BOOT0	- 0	NA	mA
	Injected current on PC0, PC1, PC2, PC3, PF2, PA0, PA1, PA2, PA3, PF4, PA4, PA5, PA6, PA7, PC4, PC5, PB2 with current injection on other pins from this group limited to > -10 $\mu$ A and < -50 $\mu$ A	- 5		
	Injected current on PB0, PB1, PE7, PE8, PE9, PE10, PE11, PE12, PE13, PE14, PE15, PB12, PB13, PB14, PB15, PD8, PD9, PD10, PD11, PD12, PD13, PD14 with current injection on other pins from this group limited to > -10 $\mu$ A and < -50 $\mu$ A	- 5		
	Injected current on PC0, PC1, PC2, PC3, PF2, PA0, PA1, PA2, PA3, PF4, PA4, PA5, PA6, PA7, PC4, PC5, PB2, PB0, PB1, PE7, PE8, PE9, PE10, PE11, PE12, PE13, PE14, PE15, PB12, PB13, PB14, PB15, PD8, PD9, PD10, PD11, PD12, PD13, PD14 with current injection on other pins from this group limited to > 10 $\mu$ A and < 400 $\mu$ A		+5	
	Injected current on any other FT, FTf pins with current injection on adjacent pins < -5 $\mu$ A	- 5	NA	
	Injected current on any other TTa pins with current injection on adjacent pins < -5 $\mu$ A	- 5	+5	
	Injected current on any other TC pins with current injection on adjacent pins < -5 $\mu$ A	- 5	+5	

**Note:** *It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.*

### 6.3.13 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 51](#) are derived from tests performed under the conditions summarized in [Table 24](#). All I/Os are CMOS and TTL compliant.

**Table 51. I/O static characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL}$	Standard I/O input low level voltage		-0.3	-	$0.3V_{DD}+0.07$	V
	TTa I/O input low level voltage		-0.3	-	$0.3V_{DD}+0.07$	
	FT and FTf <sup>(1)</sup> I/O input low level voltage		-0.3	-	$0.475V_{DD}-0.2$	
	BOOT0 input low level voltage		0	-	$0.3V_{DD}-0.3$	
$V_{IH}$	Standard I/O input high level voltage		$0.445V_{DD}+0.398$	-	$V_{DD}+0.3$	V
	TTa I/O input high level voltage		$0.445V_{DD}+0.398$	-	$V_{DD}+0.3$	
	FT and FTf <sup>(1)</sup> I/O input high level voltage		$0.5V_{DD}+0.2$	-	5.5	
	BOOT0 input high level voltage		$0.2V_{DD}+0.95$	-	5.5	
$V_{hys}$	Standard I/O Schmitt trigger voltage hysteresis <sup>(2)</sup>		200	-	-	mV
	TTa I/O Schmitt trigger voltage hysteresis <sup>(2)</sup>		200	-	-	
	FT and FTf I/O Schmitt trigger voltage hysteresis <sup>(2)</sup>		100	-	-	
	BOOT0 input Schmitt trigger voltage hysteresis <sup>(2)</sup>		300	-	-	

Table 51. I/O static characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{lkg}$	Input leakage current <sup>(3)</sup>	$V_{SS} \leq V_{IN} \leq V_{DD}$ I/O TC, FT and FTf	-	-	$\pm 0.1$	$\mu A$
		$V_{SS} \leq V_{IN} \leq V_{DD}$ $V \leq V_{DD} \leq V_{DDA} \leq 3.6 V$ I/O TTa used in digital mode	-	-	$\pm 0.1$	
		$V_{IN} = 5 V$ I/O FT and FTf	-	-	10	
		$V_{IN} = 3.6 V$ , $V \leq V_{DD} \leq V_{IN}$ $V_{DDA} = 3.6 V$ I/O TTa used in digital mode	-	-	1	
		$V_{SS} \leq V_{IN} \leq V_{DDA}$ $V \leq V_{DD} \leq V_{DDA} \leq 3.6 V$ I/O TTa used in analog mode	-	-	$\pm 0.2$	
$R_{PU}$	Weak pull-up equivalent resistor <sup>(4)</sup>	$V_{IN} = V_{SS}$	25	40	55	$k\Omega$
$R_{PD}$	Weak pull-down equivalent resistor <sup>(4)</sup>	$V_{IN} = V_{DD}$	25	40	55	$k\Omega$
$C_{IO}$	I/O pin capacitance		-	5	-	pF

1. To sustain a voltage higher than  $V_{DD}+0.3$  the internal pull-up/pull-down resistors must be disabled.
2. Hysteresis voltage between Schmitt trigger switching levels. Data based on characterization, not tested in production.
3. Leakage could be higher than max. if negative current is injected on adjacent pins.
4. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This MOS/NMOS contribution to the series resistance is minimum (~10% order).

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements is shown in [Figure 17](#) and [Figure 18](#) for standard I/Os.

Figure 17. TC and Tta I/O input characteristics - CMOS port

Figure 18. TC and Tta I/O input characteristics - TTL port

Figure 19. Five volt tolerant (FT and FTf) I/O input characteristics - CMOS port

**Figure 20. Five volt tolerant (FT and FTf) I/O input characteristics - TTL port**

### Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA, and sink or source up to  $\pm 20$  mA (with a relaxed  $V_{OL}/V_{OH}$ ).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 6.2](#):

- The sum of the currents sourced by all the I/Os on  $V_{DD}$ , plus the maximum Run consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $I_{VDD}$  (see [Table 22](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$  plus the maximum Run consumption of the MCU sunk on  $V_{SS}$  cannot exceed the absolute maximum rating  $I_{VSS}$  (see [Table 22](#)).

### Output voltage levels

Unless otherwise specified, the parameters given in [Table 52](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 24](#). All I/Os (FT, TTa and Tc unless otherwise specified) are CMOS and TTL compliant.

**Table 52. Output voltage characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	CMOS port <sup>(2)</sup> $I_{IO} = +8$ mA $2.7$ V < $V_{DD}$ < $3.6$ V	-	0.4	V
$V_{OH}^{(3)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-0.4$	-	
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	TTL port <sup>(2)</sup> $I_{IO} = +8$ mA $2.7$ V < $V_{DD}$ < $3.6$ V	-	0.4	
$V_{OH}^{(3)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		2.4	-	
$V_{OL}^{(1)(4)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	$I_{IO} = +20$ mA $2.7$ V < $V_{DD}$ < $3.6$ V	-	1.3	
$V_{OH}^{(3)(4)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-1.3$	-	
$V_{OL}^{(1)(4)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	$I_{IO} = +6$ mA $2$ V < $V_{DD}$ < $2.7$ V	-	0.4	
$V_{OH}^{(3)(4)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-0.4$	-	
$V_{OLFM+}$	Output low level voltage for an FTf I/O pin in FM+ mode	$I_{IO} = +20$ mA $2.7$ V < $V_{DD}$ < $3.6$ V	-	0.4	

1. The  $I_{IO}$  current sunk by the device must always respect the absolute maximum rating specified in [Table 22](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. The  $I_{IO}$  current sourced by the device must always respect the absolute maximum rating specified in [Table 22](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VDD}$ .
4. Data based on characterization results, not tested in production.

### Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Figure 21](#) and [Table 53](#), respectively.

Unless otherwise specified, the parameters given are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 24](#).

**Table 53. I/O AC characteristics<sup>(1)</sup>**

OSPEEDRx [1:0] value <sup>(1)</sup>	Symbol	Parameter	Conditions	Min	Max	Unit
x0	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		2	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		125 <sup>(3)</sup>	ns
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time			125 <sup>(3)</sup>	
01	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		10	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		25 <sup>(3)</sup>	ns
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time			25 <sup>(3)</sup>	
11	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 30 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		50	MHz
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		30	MHz
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		20	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 30 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		5 <sup>(3)</sup>	ns
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		8 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		12 <sup>(3)</sup>	
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time	$C_L = 30 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		5 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		8 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		12 <sup>(3)</sup>	
FM+ configuration <sup>(4)</sup>	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	TBD		TBD	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	TBD		TBD	ns
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time	TBD		TBD	
-	$t_{\text{EXTI}pw}$	Pulse width of external signals detected by the EXTI controller		10		ns

1. The I/O speed is configured using the OSPEEDRx[1:0] bits. Refer to the RM0316 reference manual for a description of GPIO Port configuration register.
2. The maximum frequency is defined in [Figure 21](#).
3. Guaranteed by design, not tested in production.
4. The I/O speed configuration is bypassed in FM+ I/O mode. Refer to the STM32F30x reference manual RM0316 for a description of FM+ I/O mode configuration.

Figure 21. I/O AC characteristics definition

### 6.3.14 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 51](#)).

Unless otherwise specified, the parameters given in [Table 54](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 24](#).

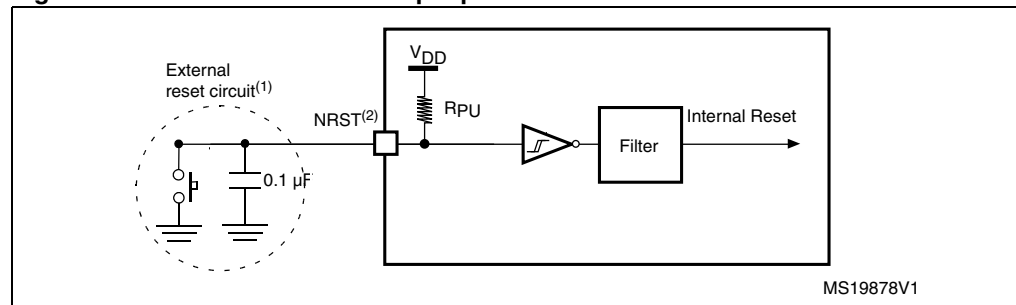

Table 54. NRST pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}^{(1)}$	NRST Input low level voltage		-0.5		0.8	V
$V_{IH(NRST)}^{(1)}$	NRST Input high level voltage		2		$V_{DD}+0.5$	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis			200		mV
$R_{PU}$	Weak pull-up equivalent resistor <sup>(2)</sup>	$V_{IN} = V_{SS}$	25	40	55	k $\Omega$
$V_{F(NRST)}^{(1)}$	NRST Input filtered pulse				100	ns
$V_{NF(NRST)}^{(1)}$	NRST Input not filtered pulse		300			ns

1. Guaranteed by design, not tested in production.

2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).

Figure 22. Recommended NRST pin protection

1. The reset network protects the device against parasitic resets.

2. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 54](#). Otherwise the reset will not be taken into account by the device.

### 6.3.15 Timer characteristics

The parameters given in [Table 55](#) are guaranteed by design.

Refer to [Section 6.3.13: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

**Table 55. TIMx<sup>(1)</sup> characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time		1		$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$	13.9		ns
		$f_{TIMxCLK} = 144\text{MHz}$ , $x = 1.8$	6.95		ns
$f_{EXT}$	Timer external clock frequency on CH1 to CH4		0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 72\text{ MHz}$	0	36	MHz
		$f_{TIMxCLK} = 144\text{MHz}$ , $x = 1.8$	0	72	MHz
$Res_{TIM}$	Timer resolution	TIMx (except TIM2)		16	bit
		TIM2		32	
$t_{COUNTER}$	16-bit counter clock period		1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$	0.0139	910	$\mu\text{s}$
$t_{MAX\_COUNT}$	Maximum possible count with 32-bit counter			$65536 \times 65536$	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$			s

1. TIMx is used as a general term to refer to the TIM1, TIM2, TIM3, TIM6, TIM14, TIM15, TIM16 and TIM17 timers.

**Table 56. IWDG min/max timeout period at 40 kHz (LSI) <sup>(1)</sup>**

Prescaler divider	PR[2:0] bits	Min timeout (ms) RL[11:0]= 0x000	Max timeout (ms) RL[11:0]= 0xFFFF
/4	0	0.1	409.6
/8	1	0.2	819.2
/16	2	0.4	1638.4
/32	3	0.8	3276.8
/64	4	1.6	6553.6
/128	5	3.2	13107.2
/256	7	6.4	26214.4

1. These timings are given for a 40 kHz clock but the microcontroller's internal RC frequency can vary from 30 to 60 kHz. Moreover, given an exact RC oscillator frequency, the exact timings still depend on the phasing of the APB interface clock versus the LSI clock so that there is always a full RC period of uncertainty.

Table 57. WWDG min-max timeout value @72 MHz (PCLK)

Prescaler	WDGTB	Min timeout value	Max timeout value
1	0	0.05687	3.6409
2	1	0.1137	7.2817
4	2	0.2275	14.564
8	3	0.4551	29.127

### 6.3.16 Communications interfaces

#### I<sup>2</sup>C interface characteristics

Unless otherwise specified, the parameters given in [Table 58](#) are derived from tests performed under ambient temperature,  $f_{\text{PCLK1}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions summarized in [Table 24](#).

The I<sup>2</sup>C interface meets the requirements of the standard I<sup>2</sup>C communication protocol with the following restrictions: the I/O pins SDA and SCL are mapped to are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and  $V_{\text{DD}}$  is disabled, but is still present.

The I<sup>2</sup>C characteristics are described in [Table 58](#). Refer also to [Section 6.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (SDA and SCL).

**Table 58. I<sup>2</sup>C characteristics<sup>(1)</sup>**

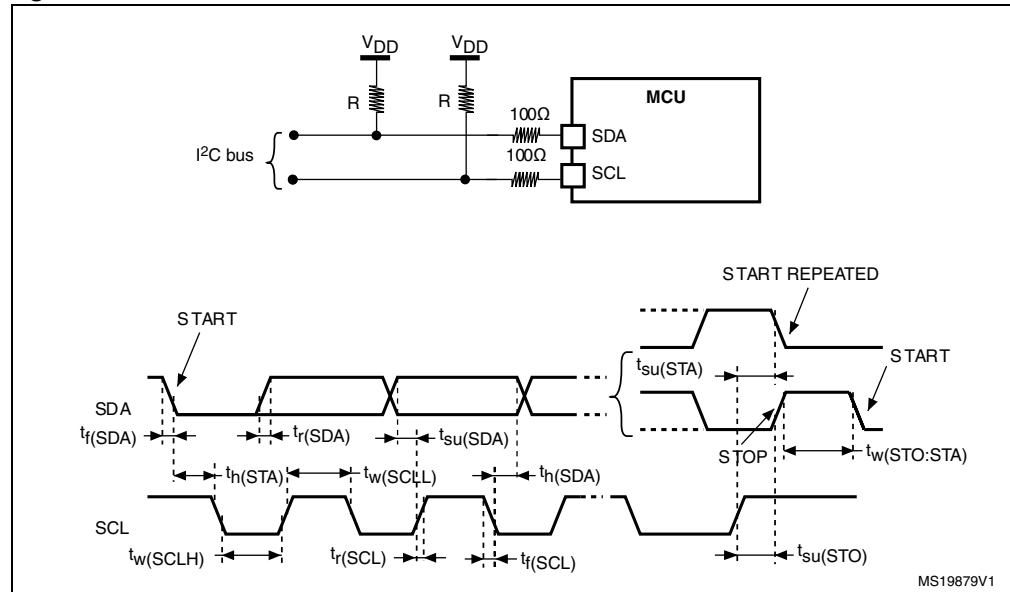

Symbol	Parameter	Standard mode		Fast mode		Fast Mode Plus		Unit
		Min	Max	Min	Max	Min	Max	
$t_{\text{w}}(\text{SCL})$	SCL clock low time	4.7		1.3		0.5		$\mu\text{s}$
$t_{\text{w}}(\text{SCLH})$	SCL clock high time	4.0		0.6		0.26		
$t_{\text{su}}(\text{SDA})$	SDA setup time	250		100		50		ns
$t_{\text{h}}(\text{SDA})$	SDA data hold time	0 <sup>(3)</sup>	3450 <sup>(2)</sup>	0 <sup>(3)</sup>	900 <sup>(2)</sup>	0	450	
$t_{\text{r}}(\text{SDA})$ $t_{\text{r}}(\text{SCL})$	SDA and SCL rise time		1000		300		120	
$t_{\text{f}}(\text{SDA})$ $t_{\text{f}}(\text{SCL})$	SDA and SCL fall time		300		300		120	
$t_{\text{h}}(\text{STA})$	Start condition hold time	4.0		0.6		0.26		$\mu\text{s}$
$t_{\text{su}}(\text{STA})$	Repeated Start condition setup time	4.7		0.6		0.26		
$t_{\text{su}}(\text{STO})$	Stop condition setup time	4.0		0.6		0.26		$\mu\text{s}$
$t_{\text{w}}(\text{STO:STA})$	Stop to Start condition time (bus free)	4.7		1.3		0.5		$\mu\text{s}$
$C_{\text{b}}$	Capacitive load for each bus line		400		400		550	pF

1. The I<sup>2</sup>C characteristics are the requirements from I<sup>2</sup>C bus specification rev03. They are guaranteed by design when I2Cx\_TIMING register is correctly programmed (Refer to reference manual). These characteristics are not tested in production.
2. The maximum Data hold time has only to be met if the interface does not stretch the low period of SCL signal.
3. The device must internally provide a hold time of at least 300ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

**Table 59. I<sup>2</sup>C analog filter characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Max	Unit
$t_{\text{SP}}$	Pulse width of spikes that are suppressed by the analog filter	50	260	ns

1. Guaranteed by design, not tested in production.

Figure 23. I<sup>2</sup>C bus AC waveforms and measurement circuit

1. Measurement points are done at CMOS levels: 0.3V<sub>DD</sub> and 0.7V<sub>DD</sub>.

**SPI/I<sup>2</sup>S characteristics**

Unless otherwise specified, the parameters given in [Table 60](#) for SPI or in [Table 61](#) for I<sup>2</sup>S are derived from tests performed under ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 24](#).

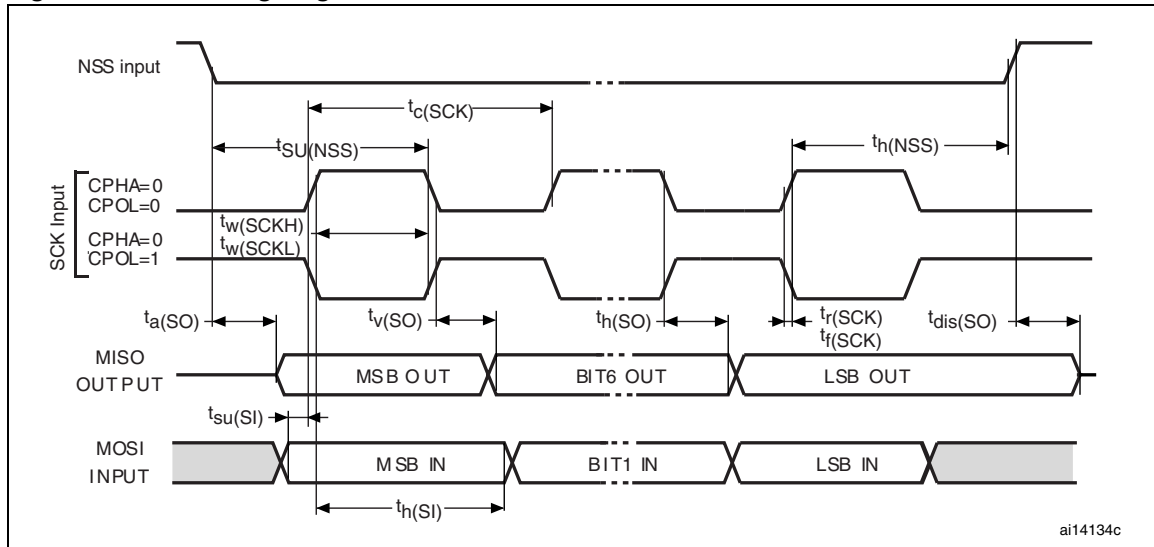

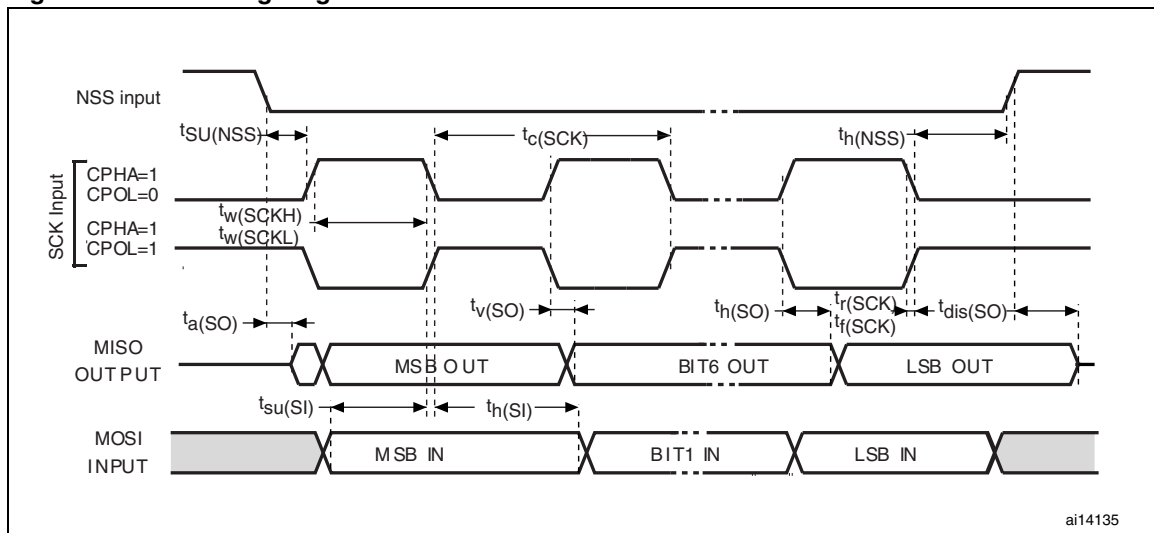

Refer to [Section 6.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I<sup>2</sup>S).

**Table 60. SPI characteristics**

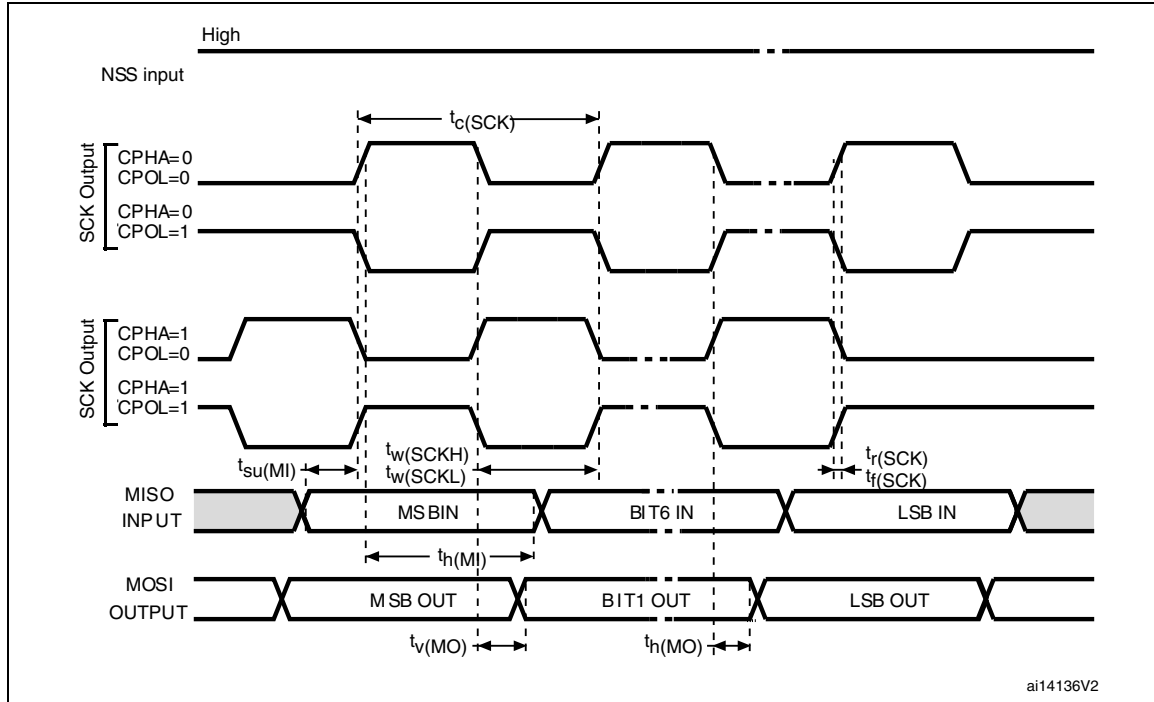

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{SCK}$ $1/t_{c(SCK)}^{(1)}$	SPI clock frequency	Master mode		18	MHz
		Slave mode		18	
$t_{r(SCK)}^{(1)}$ $t_{f(SCK)}^{(1)}$	SPI clock rise and fall time	Capacitive load: C = 30 pF		8	ns
$DuCy(SCK)^{(1)}$	SPI slave input clock duty cycle	Slave mode	30	70	%
$t_{su(NSS)}^{(1)}$	NSS setup time	Slave mode	2T <sub>pclk</sub>		ns
$t_{h(NSS)}^{(1)}$	NSS hold time	Slave mode	4T <sub>pclk</sub>		
$t_{w(SCKH)}^{(1)}$ $t_{w(SCKL)}^{(1)}$	SCK high and low time	Master mode, $f_{PCLK} = 36$ MHz, presc = 4	T <sub>pclk</sub> /2 - 3	T <sub>pclk</sub> /2 + 3	
$t_{su(MI)}^{(1)}$ $t_{su(SI)}^{(1)}$	Data input setup time	Master mode	5.5		
		Slave mode	6.5		
$t_{h(MI)}^{(1)}$ $t_{h(SI)}^{(1)}$	Data input hold time	Master mode	5		
		Slave mode	5		
$t_{a(SO)}^{(1)(2)}$	Data output access time	Slave mode, $f_{PCLK} = 24$ MHz	0	4T <sub>pclk</sub>	
$t_{dis(SO)}^{(1)(3)}$	Data output disable time	Slave mode	0	24	
$t_{v(SO)}^{(1)}$	Data output valid time	Slave mode (after enable edge)		39	
$t_{v(MO)}^{(1)}$	Data output valid time	Master mode (after enable edge)		3	
$t_{h(SO)}^{(1)}$ $t_{h(MO)}^{(1)}$	Data output hold time	Slave mode (after enable edge)	15		
		Master mode (after enable edge)	4		

1. Data based on characterization results, not tested in production.
2. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.
3. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

Figure 24. SPI timing diagram - slave mode and CPHA = 0

Figure 25. SPI timing diagram - slave mode and CPHA = 1<sup>(1)</sup>

1. Measurement points are done at CMOS levels:  $0.3V_{DD}$  and  $0.7V_{DD}$ .

Figure 26. SPI timing diagram - master mode<sup>(1)</sup>

1. Measurement points are done at CMOS levels:  $0.3V_{DD}$  and  $0.7V_{DD}$ .

Table 61. I<sup>2</sup>S characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{CK}$ $1/t_{c(CK)}$	I <sup>2</sup> S clock frequency	Master data: 16 bits, audio freq=48K	1.496	1.503	MHz
		Slave	0	12.288	
$t_{r(CK)}$ $t_{f(CK)}$	I <sup>2</sup> S clock rise and fall time	Capacitive load $C_L = 30 \text{ pF}$		8	ns
$t_{w(CKH)}^{(1)}$	I <sup>2</sup> S clock high time	Master $f_{PCLK} = 36 \text{ MHz}$ , audio frequency = 48 kHz	331		
$t_{w(CKL)}^{(1)}$	I <sup>2</sup> S clock low time		332		
$t_{v(WS)}^{(1)}$	WS valid time	Master mode	4		
$t_{h(WS)}^{(1)}$	WS hold time	Master mode	4		
$t_{su(WS)}^{(1)}$	WS setup time	Slave mode	4		
$t_{h(WS)}^{(1)}$	WS hold time	Slave mode	0		
Duty Cycle	I <sup>2</sup> S slave input clock duty cycle	Slave mode	30	70	%

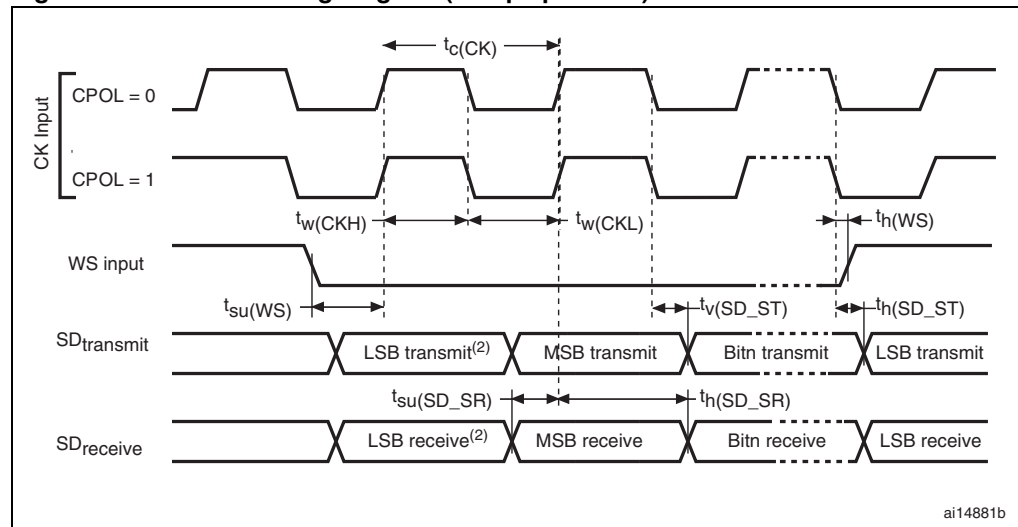

**Table 61. I<sup>2</sup>S characteristics (continued)**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{su(SD\_MR)}^{(1)}$	Data input setup time	Master receiver	9		ns
$t_{su(SD\_SR)}^{(1)}$	Data input setup time	Slave receiver	2		
$t_{h(SD\_MR)}^{(1)(2)}$	Data input hold time	Master receiver	0		
$t_{h(SD\_SR)}^{(1)(2)}$		Slave receiver	0		
$t_{v(SD\_ST)}^{(1)(2)}$	Data output valid time	Slave transmitter (after enable edge)		29	
$t_{h(SD\_ST)}^{(1)}$	Data output hold time	Slave transmitter (after enable edge)	12		
$t_{v(SD\_MT)}^{(1)(2)}$	Data output valid time	Master transmitter (after enable edge)		3	
$t_{h(SD\_MT)}^{(1)}$	Data output hold time	Master transmitter (after enable edge)	2		

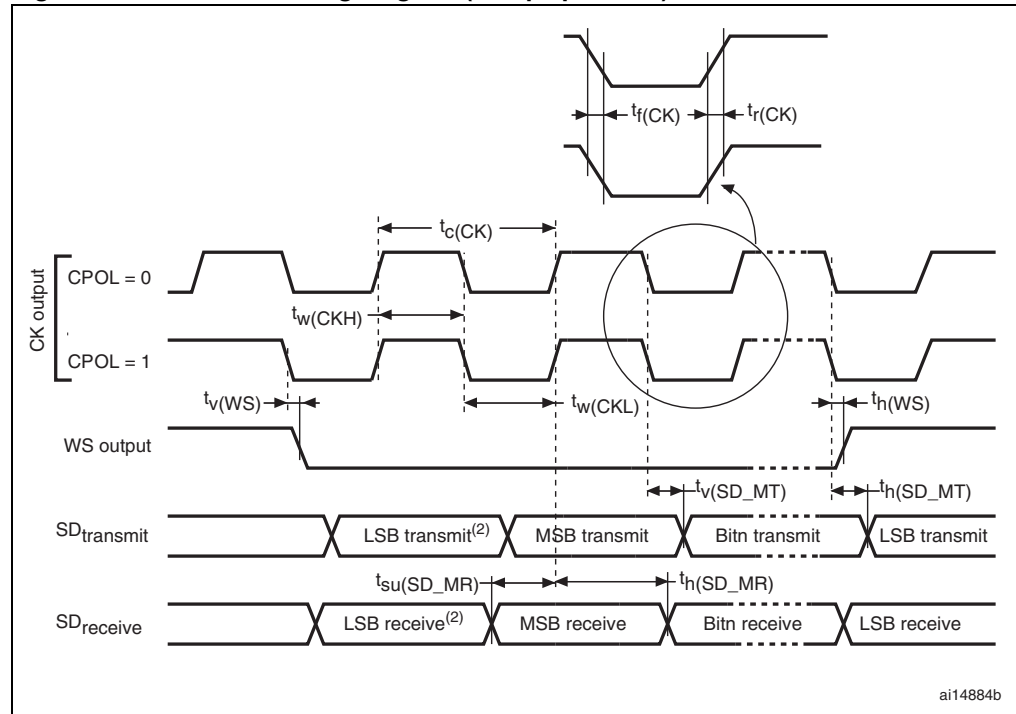

1. Data based on design simulation and/or characterization results, not tested in production.

2. Depends on  $f_{PCLK}$ . For example, if  $f_{PCLK}=8$  MHz, then  $T_{PCLK} = 1/f_{PCLK} = 125$  ns.

**Figure 27. I<sup>2</sup>S slave timing diagram (Philips protocol)<sup>(1)</sup>**

1. Measurement points are done at CMOS levels:  $0.3 \times V_{DD}$  and  $0.7 \times V_{DD}$ .

2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 28. I<sup>2</sup>S master timing diagram (Philips protocol)<sup>(1)</sup>

1. Data based on characterization results, not tested in production.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

## USB characteristics

Table 62. USB startup time

Symbol	Parameter	Max	Unit
$t_{STARTUP}^{(1)}$	USB transceiver startup time	1	$\mu s$

1. Guaranteed by design, not tested in production.

Table 63. USB DC electrical characteristics

Symbol	Parameter	Conditions	Min. <sup>(1)</sup>	Max. <sup>(1)</sup>	Unit
Input levels					
V <sub>DD</sub>	USB operating voltage <sup>(2)</sup>		3.0 <sup>(3)</sup>	3.6	V
V <sub>DI</sub> <sup>(4)</sup>	Differential input sensitivity	I(USBDP, USBDM)	0.2		V
V <sub>CM</sub> <sup>(4)</sup>	Differential common mode range	Includes V <sub>DI</sub> range	0.8	2.5	
V <sub>SE</sub> <sup>(4)</sup>	Single ended receiver threshold		1.3	2.0	
Output levels					
V <sub>OL</sub>	Static output level low	R <sub>L</sub> of 1.5 kΩ to 3.6 V <sup>(5)</sup>		0.3	V
V <sub>OH</sub>	Static output level high	R <sub>L</sub> of 15 kΩ to V <sub>SS</sub> <sup>(5)</sup>	2.8	3.6	

1. All the voltages are measured from the local ground potential.

2. To be compliant with the USB 2.0 full-speed electrical specification, the USBDP (D+) pin should be pulled up with a 1.5 k $\Omega$  resistor to a 3.0-to-3.6 V voltage range.
3. The STM32F3xxx USB functionality is ensured down to 2.7 V but not the full USB electrical characteristics which are degraded in the 2.7-to-3.0 V  $V_{DD}$  voltage range.
4. Guaranteed by design, not tested in production.
5.  $R_L$  is the load connected on the USB drivers

**Figure 29. USB timings: definition of data signal rise and fall time**

Table 64. USB: Full-speed electrical characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Driver characteristics</b>						
$t_r$	Rise time <sup>(2)</sup>	$C_L = 50 \text{ pF}$	4	-	20	ns
$t_f$	Fall time <sup>(2)</sup>	$C_L = 50 \text{ pF}$	4	-	20	ns
$t_{rfm}$	Rise/ fall time matching	$t_r/t_f$	90	-	110	%
$V_{CRS}$	Output signal crossover voltage		1.3	-	2.0	V
Output driver Impedance <sup>(3)</sup>	$Z_{DRV}$	driving high and low	28	40	44	$\Omega$

1. Guaranteed by design, not tested in production.
2. Measured from 10% to 90% of the data signal. For more detailed informations, please refer to USB Specification - Chapter 7 (version 2.0).
3. No external termination series resistors are required on USBDP (D+) and USBDM (D-), the matching impedance is already included in the embedded driver.

### CAN (controller area network) interface

Refer to [Section 6.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (CAN\_TX and CAN\_RX).

### 6.3.17 ADC characteristics

Unless otherwise specified, the parameters given in [Table 65](#) to [Table 67](#) are guaranteed by design.

**Table 65. ADC characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDA}$	Analog supply voltage for ADC		2		3.6	V
$f_{ADC}$	ADC clock frequency		0.14		72	MHz
$f_S^{(1)}$	Sampling rate	Resolution = 12 bits, Fast Channel	0.01		5.14	MSPS
		Resolution = 10 bits, Fast Channel	0.012		6	
		Resolution = 8 bits, Fast Channel	0.014		7.2	
		Resolution = 6 bits, Fast Channel	0.0175		9	
$f_{TRIG}^{(1)}$	External trigger frequency	$f_{ADC} = 72$ MHz Resolution = 12 bits			5.14	MHz
		Resolution = 12 bits			14	$1/f_{ADC}$
$V_{AIN}$	Conversion voltage range		0		$V_{DDA}$	V
$R_{AIN}^{(1)}$	External input impedance				100	k $\Omega$
$C_{ADC}^{(1)}$	Internal sample and hold capacitor			5		pF
$t_{CAL}^{(1)}$	Calibration time	$f_{ADC} = 72$ MHz	1.56			$\mu$ s
			112			$1/f_{ADC}$
$t_{latr}^{(1)}$	Trigger conversion latency Regular and injected channels without conversion abort	CKMODE = 00	1.5	2	2.5	$1/f_{ADC}$
		CKMODE = 01			2	$1/f_{ADC}$
		CKMODE = 10			2.25	$1/f_{ADC}$
		CKMODE = 11			2.125	$1/f_{ADC}$
$t_{latrinj}$	Trigger conversion latency Injected channels aborting a regular conversion	CKMODE = 00	2.5	3	3.5	$1/f_{ADC}$
		CKMODE = 01			3	$1/f_{ADC}$
		CKMODE = 10			3.25	$1/f_{ADC}$
		CKMODE = 11			3.125	$1/f_{ADC}$
$t_S^{(1)}$	Sampling time	$f_{ADC} = 72$ MHz	0.021		8.35	$\mu$ s
			1.5		601.5	$1/f_{ADC}$
$T_{ADCVRREG\_STUP}^{(1)}$	ADC Voltage Regulator Start-up time				10	$\mu$ s
$t_{CONV}^{(1)}$	Total conversion time (including sampling time)	$f_{ADC} = 72$ MHz Resolution = 12 bits	0.19		3.5	$\mu$ s
		Resolution = 12 bits	14 to 252 ( $t_S$ for sampling + 12.5 for successive approximation)			$1/f_{ADC}$

1. Data guaranteed by design

Table 66. Minimum sampling time to be respected for fast and slow channels

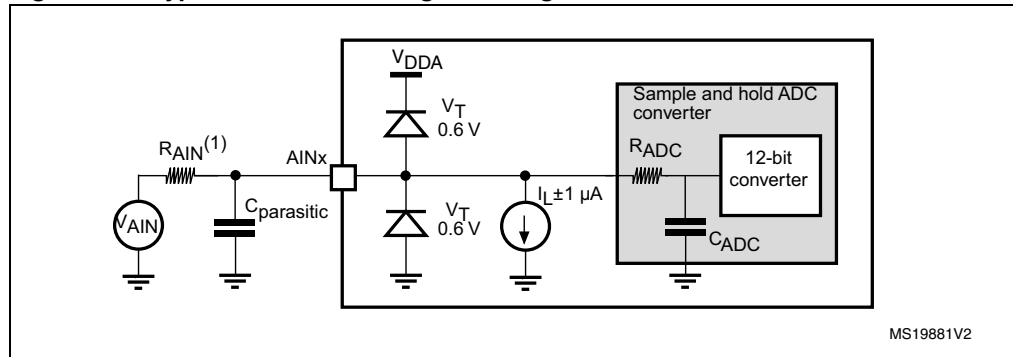

Resolution	$R_{AIN}$ (K Ohm)	Minimum sampling time (ns)		Resolution	$R_{AIN}$ (K Ohm)	Minimum sampling time (ns)	
		Fast channels	Slow channels			Fast channels	Slow channels
12-bit	0	12	17	8-bit	0	7	11
	0.05	16	21		0.05	10	14
	0.1	20	25		0.1	13	16
	0.2	27	33		0.2	18	22
	0.5	52	58		0.5	35	38
	1	94	99		1	63	66
	5	430	435		5	285	289

	20	1690	1690		20	1120	1120
	50	4190	4200		50	2780	2790
	100	8350	8350		100	5550	5550
10-bit	0	9	14	6-bit	0	5	8
	0.05	13	17		0.05	7	10
	0.1	16	21		0.1	9	12
	0.2	23	27		0.2	13	16
	0.5	43	48		0.5	26	28
	1	78	83		1	47	49
	5	358	362		5	213	216
	10	706	710		10	421	423
	20	1400	1410		20	836	839
	50	3490	3490		50	2080	2080
	100	6950	6950		100	4150	4150

**Table 67. ADC accuracy<sup>(1)(2)(3)</sup>**

Symbol	Parameter	Test conditions	Typ	Max <sup>(4)</sup>	Unit
ET	Total unadjusted error	TBD	TBD	TBD	LSB
EO	Offset error		TBD	TBD	
EG	Gain error		TBD	TBD	
ED	Differential linearity error		TBD	TBD	
EL	Integral linearity error		TBD	TBD	
ENOB	Effective number of bits	TBD	±TBD	±TBD	bits
SINAD	Signal-to-noise and distortion ratio		±TBD	±TBD	dB
SNR	Signal-to-noise ratio		±TBD	±TBD	
THD	Total harmonic distortion		±TBD	±TBD	

1. ADC DC accuracy values are measured after internal calibration.
2. ADC accuracy vs. negative Injection Current: Injecting negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative current.  
Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 6.3.13](#) does not affect the ADC accuracy.
3. Better performance may be achieved in restricted  $V_{DDA}$ , frequency and temperature ranges.
4. Data based on characterization results, not tested in production.

**Figure 30. ADC accuracy characteristics**

**Figure 31. Typical connection diagram using the ADC**

1. Refer to [Table 65](#) for the values of  $R_{AIN}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high  $C_{parasitic}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

### General PCB design guidelines

Power supply decoupling should be performed as shown in [Figure 11](#). The 10 nF capacitor should be ceramic (good quality) and it should be placed as close as possible to the chip.

### 6.3.18 DAC electrical specifications

**Table 68. DAC characteristics**

Symbol	Parameter	Min	Typ	Max	Unit	Comments
$V_{DDA}$	Analog supply voltage for DAC ON	2.4		3.6	V	
$R_{LOAD}^{(1)}$	Resistive load with buffer ON	5			k $\Omega$	
$R_O^{(1)}$	Impedance output with buffer OFF			15	k $\Omega$	When the buffer is OFF, the Minimum resistive load between DAC_OUT and $V_{SS}$ to have a 1% accuracy is 1.5 M $\Omega$
$C_{LOAD}^{(1)}$	Capacitive load			50	pF	Maximum capacitive load at DAC_OUT pin (when the buffer is ON).
DAC_OUT min <sup>(1)</sup>	Lower DAC_OUT voltage with buffer ON	0.2			V	It gives the maximum output excursion of the DAC. It corresponds to 12-bit input code (0x0E0) to (0xF1C) at $V_{DDA} = 3.6$ V and (0x155) and (0xEAB) at $V_{DDA} = 2.4$ V
DAC_OUT max <sup>(1)</sup>	Higher DAC_OUT voltage with buffer ON			$V_{DDA} - 0.2$	V	
DAC_OUT min <sup>(1)</sup>	Lower DAC_OUT voltage with buffer OFF		0.5		mV	It gives the maximum output excursion of the DAC.
DAC_OUT max <sup>(1)</sup>	Higher DAC_OUT voltage with buffer OFF			$V_{DDA} - 1\text{LSB}$	V	
$I_{DDA}$	DAC DC current consumption in quiescent mode (Standby mode)			380	$\mu$ A	With no load, middle code (0x800) on the input
				480	$\mu$ A	With no load, worst code (0xF1C) on the input
DNL <sup>(2)</sup>	Differential non linearity Difference between two consecutive code-1LSB)			$\pm 0.5$	LSB	Given for a 10-bit input code
				$\pm 2$	LSB	Given for a 12-bit input code
INL <sup>(2)</sup>	Integral non linearity (difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 1023)			$\pm 1$	LSB	Given for a 10-bit input code
				$\pm 4$	LSB	Given for a 12-bit input code
Offset <sup>(2)</sup>	Offset error (difference between measured value at Code (0x800) and the ideal value = $V_{DDA}/2$ )			$\pm 10$	mV	Given for a 12-bit input code
				$\pm 3$	LSB	Given for a 10-bit input code at $V_{DDA} = 3.6$ V
				$\pm 12$	LSB	Given for a 12-bit input code at $V_{DDA} = 3.6$ V
Gain error <sup>(2)</sup>	Gain error			$\pm 0.5$	%	Given for a 12-bit input code

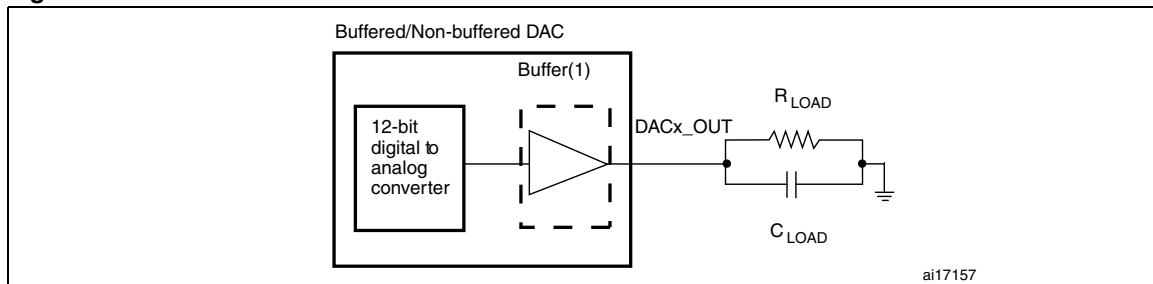

Table 68. DAC characteristics (continued)

Symbol	Parameter	Min	Typ	Max	Unit	Comments
$t_{\text{SETTLING}}^{(2)}$	Settling time (full scale: for a 10-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches final value $\pm 1\text{LSB}$ )		3	4	$\mu\text{s}$	$C_{\text{LOAD}} \leq 50 \text{ pF}$ , $R_{\text{LOAD}} \geq 5 \text{ k}\Omega$
Update rate <sup>(2)</sup>	Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB)			1	MS/s	$C_{\text{LOAD}} \leq 50 \text{ pF}$ , $R_{\text{LOAD}} \geq 5 \text{ k}\Omega$
$t_{\text{WAKEUP}}^{(2)}$	Wakeup time from off state (Setting the ENx bit in the DAC Control register)		6.5	10	$\mu\text{s}$	$C_{\text{LOAD}} \leq 50 \text{ pF}$ , $R_{\text{LOAD}} \geq 5 \text{ k}\Omega$ input code between lowest and highest possible ones.
PSRR+ <sup>(1)</sup>	Power supply rejection ratio (to $V_{\text{DDA}}$ ) (static DC measurement)		-67	-40	dB	No $R_{\text{LOAD}}$ , $C_{\text{LOAD}} = 50 \text{ pF}$

1. Guaranteed by design, not tested in production.

2. Data based on characterization results, not tested in production.

Figure 32. 12-bit buffered /non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

### 6.3.19 Comparator characteristics

**Table 69. Comparator characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max <sup>(1)</sup>	Unit		
V <sub>DDA</sub>	Analog supply voltage		2		3.6	V		
V <sub>IN</sub>	Comparator input voltage range		0		V <sub>DDA</sub>			
V <sub>BG</sub>	Scaler input voltage			1.2				
V <sub>SC</sub>	Scaler offset voltage			±5	±10	mV		
t <sub>S_SC</sub>	Scaler startup time from power down				0.1	ms		
t <sub>START</sub>	Comparator startup time	Startup time to reach propagation delay specification			60	μs		
t <sub>D</sub>	Propagation delay for 200 mV step with 100 mV overdrive	Ultra-low power mode			2	4.5	μs	
		Low power mode			0.7	1.5		
		Medium power mode			0.3	0.6		
		High speed mode	V <sub>DDA</sub> ≥ 2.7 V			50	100	ns
			V <sub>DDA</sub> < 2.7 V			100	240	
	Propagation delay for full range step with 100 mV overdrive	Ultra-low power mode			2	7	μs	
		Low power mode			0.7	2.1		
		Medium power mode			0.3	1.2		
		High speed mode	V <sub>DDA</sub> ≥ 2.7 V			90	180	ns
			V <sub>DDA</sub> < 2.7 V			110	300	
V <sub>offset</sub>	Comparator offset error			±4	±10	mV		
dV <sub>offset</sub> /dT	Offset error temperature coefficient			18		μV/°C		
I <sub>DD(COMP)</sub>	COMP current consumption	Ultra-low power mode			1.2	1.5	μA	
		Low power mode			3	5		
		Medium power mode			10	15		
		High speed mode			75	100		

Table 69. Comparator characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max <sup>(1)</sup>	Unit
$V_{\text{hys}}$	Comparator hysteresis	No hysteresis (COMPxHYST[1:0]=00)		0		mV
		Low hysteresis (COMPxHYST[1:0]=01)	High speed mode	3	8	13
			All other power modes	5		10
		Medium hysteresis (COMPxHYST[1:0]=10)	High speed mode	7	15	26
			All other power modes	9		19
		High hysteresis (COMPxHYST[1:0]=11)	High speed mode	18	31	49
			All other power modes	19		40

1. Data based on characterization results, not tested in production.

### 6.3.20 Operational amplifier characteristics

Table 70. Operational amplifier characteristics<sup>(1)</sup>

Symbol	Parameter		Condition	Min	Typ	Max	Unit
V <sub>DDA</sub>	Analog supply voltage			2.4		3.6	V
CMIR	Common mode input range			0		V <sub>DDA</sub>	V
V <sub>I</sub> OFFSET	Input offset voltage	Maximum calibration range	25°C, No Load on output.			4	mV
			All voltage/Temp.			6	
		After offset calibration	25°C, No Load on output.			1.6	
			All voltage/Temp.			3	
ΔV <sub>I</sub> OFFSET	Input offset voltage drift				5		μV/°C
I <sub>LOAD</sub>	Drive current					500	μA
IDDOPAMP	Consumption		No load, quiescent mode		690	1450	μA
CMRR	Common mode rejection ratio				90		dB
PSRR	Power supply rejection ratio		DC	73	117		dB
GBW	Bandwidth				8.2		MHz
SR	Slew rate				4.7		V/μs
R <sub>LOAD</sub>	Resistive load			4			kΩ
C <sub>LOAD</sub>	Capacitive load					50	pF
VOH <sub>SAT</sub>	High saturation voltage	R <sub>load</sub> = min, Input at V <sub>DDA</sub> .				100	mV
		R <sub>load</sub> = 20K, Input at V <sub>DDA</sub> .				20	
VOL <sub>SAT</sub>	Low saturation voltage	Rload = min, input at 0V				100	
		Rload = 20K, input at 0V.				20	
φm	Phase margin				62		°
t <sub>OFFTRIM</sub>	Offset trim time: during calibration, minimum time needed between two steps to have 1 mV accuracy					2	ms
t <sub>WAKEUP</sub>	Wake up time from OFF state.		C <sub>LOAD</sub> ≤ 50 pf, R <sub>LOAD</sub> ≥ 4 kΩ, Follower configuration		2.8	5	μs

**Table 70. Operational amplifier characteristics<sup>(1)</sup>**

Symbol	Parameter	Condition	Min	Typ	Max	Unit
PGA gain	Non inverting gain value			2		
				4		
				8		
				16		
PGA gain error	PGA gain error		-1%		1%	

1. Data guaranteed by design.

### 6.3.21 Temperature sensor characteristics

**Table 71. TS characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
$T_L^{(1)}$	$V_{SENSE}$ linearity with temperature		$\pm 1$	$\pm 2$	$^{\circ}\text{C}$
$\text{Avg\_Slope}^{(1)}$	Average slope	4.0	4.3	4.6	$\text{mV}/^{\circ}\text{C}$
$V_{25}$	Voltage at 25 $^{\circ}\text{C}$	1.34	1.43	1.52	V
$t_{\text{START}}^{(1)}$	Startup time	4		10	$\mu\text{s}$
$T_{\text{S\_temp}}^{(1)(2)}$	ADC sampling time when reading the temperature	2.2		-	$\mu\text{s}$

1. Guaranteed by design, not tested in production.

2. Shortest sampling time can be determined in the application by multiple iterations.

### 6.3.22 $V_{\text{BAT}}$ monitoring characteristics

**Table 72.  $V_{\text{BAT}}$  monitoring characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for $V_{\text{BAT}}$	-	50	-	$\text{K}\Omega$
Q	Ratio on $V_{\text{BAT}}$ measurement	-	2	-	
$\text{Er}^{(1)}$	Error on Q	-1	-	+1	%
$T_{\text{S\_vbat}}^{(1)(2)}$	ADC sampling time when reading the $V_{\text{BAT}}$ 1mV accuracy	2.2	-	-	$\mu\text{s}$

1. Guaranteed by design, not tested in production.

2. Shortest sampling time can be determined in the application by multiple iterations.

## 7 Package characteristics

### 7.1 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.

Technical drawing of a 4x4 grid of square cells. The grid is defined by a central vertical line and a horizontal line. The dimensions and labels are as follows:

- Top Row:**
  - Left cell: 48 (top), 49 (left), 64 (bottom), 10.3 (width)
  - Second cell: 0.5 (width)
  - Third cell: 33 (top), 32 (left), 17 (bottom), 1.2 (width)
  - Right cell: 0.3 (width)
- Bottom Row:**
  - Left cell: 1 (width)
  - Second cell: 7.8 (width)

## 7.2 Thermal characteristics

The maximum chip-junction temperature,  $T_J$  max, in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- $T_A$  max is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D$  max is the sum of  $P_{INT}$  max and  $P_{I/O}$  max ( $P_D \text{ max} = P_{INT} \text{ max} + P_{I/O} \text{ max}$ ),
- $P_{INT}$  max is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O}$  max represents the maximum power dissipation on output pins where:

$$P_{I/O} \text{ max} = \Sigma (V_{OL} \times I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \times I_{OH}),$$

taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low and high level in the application.

**Table 76. Package thermal characteristics**

Symbol	Parameter	Value	Unit
$\Theta_{JA}$	<b>Thermal resistance junction-ambient</b> LQFP 100 - 14 × 14 mm / 0.5 mm pitch	41	°C/W
	<b>Thermal resistance junction-ambient</b> LQFP 64 - 10 × 10 mm / 0.5 mm pitch	45	
	<b>Thermal resistance junction-ambient</b> LQFP 48 - 7 × 7 mm / 0.5 mm pitch	55

## 7.2.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in [Table 77: Ordering information scheme](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32F302xx/STM32F303xx at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

### Example 1: high-performance application

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 82\text{ }^{\circ}\text{C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 50\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$  and maximum 8 I/Os used at the same time in output mode at low level with  $I_{OL} = 20\text{ mA}$ ,  $V_{OL} = 1.3\text{ V}$

$$P_{INTmax} = 50\text{ mA} \times 3.5\text{ V} = 175\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} + 8 \times 20\text{ mA} \times 1.3\text{ V} = 272\text{ mW}$$

This gives:  $P_{INTmax} = 175\text{ mW}$  and  $P_{IOmax} = 272\text{ mW}$

$$P_{Dmax} = 175 + 272 = 447\text{ mW}$$

Thus:  $P_{Dmax} = 447\text{ mW}$

Using the values obtained in [Table 76](#)  $T_{Jmax}$  is calculated as follows:

– For LQFP100,  $TBD\text{ }^{\circ}\text{C/W}$

$$T_{Jmax} = 82\text{ }^{\circ}\text{C} + (45\text{ }^{\circ}\text{C/W} \times 447\text{ mW}) = 82\text{ }^{\circ}\text{C} + 20.1\text{ }^{\circ}\text{C} = 102.1\text{ }^{\circ}\text{C}$$

This is within the range of the suffix 6 version parts ( $-40 < T_J < 105\text{ }^{\circ}\text{C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 6 (see [Table 77: Ordering information scheme](#)).

### Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature  $T_J$  remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 115\text{ }^{\circ}\text{C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 20\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$

$$P_{INTmax} = 20\text{ mA} \times 3.5\text{ V} = 70\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} = 64\text{ mW}$$

This gives:  $P_{INTmax} = 70\text{ mW}$  and  $P_{IOmax} = 64\text{ mW}$ :

$$P_{Dmax} = 70 + 64 = 134\text{ mW}$$

Thus:  $P_{Dmax} = 134\text{ mW}$

Using the values obtained in [Table 76](#)  $T_{Jmax}$  is calculated as follows:

– For LQFP100, 46 °C/W

$$T_{Jmax} = 115\text{ °C} + (46\text{ °C/W} \times 134\text{ mW}) = 115\text{ °C} + 6.2\text{ °C} = 121.2\text{ °C}$$

This is within the range of the suffix 7 version parts ( $-40 < T_J < 125\text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 7 (see [Table 77: Ordering information scheme](#)).

## 8 Part numbering

**Table 77. Ordering information scheme**

Example:	STM32	F	303	R	B	T	6	xxx
<b>Device family</b>								
STM32 = ARM-based 32-bit microcontroller								
<b>Product type</b>								
F = general-purpose								
<b>Device subfamily</b>								
302 = STM32F302xx								
303 = STM32F303xx								
<b>Pin count</b>								
C = 48 pins								
R = 64 pins								
V = 100 pins								
<b>Flash memory size</b>								
B = 128 Kbytes of Flash memory (medium density)								
C = 256 Kbytes of Flash memory (high density)								
<b>Package</b>								
T = LQFP								
<b>Temperature range</b>								
6 = Industrial temperature range, –40 to 85 °C								
7 = Industrial temperature range, –40 to 105 °C								
<b>Options</b>								
xxx = programmed parts								
TR = tape and reel
