K4E661612D,K4E641612D   CMOS DRAM

4M x 16bit CMOS Dynamic RAM with Extended Data Out

DESCRIPTION

This is a family of 4,194,304 x 16 bit Extended Data Out Mode CMOS DRAMs. Extended Data Out Mode offers high speed random access of memory cells within the same row. Refresh cycle(4K Ref. or 8K Ref.), access time (-45, -50 or -60), power consumption(Normal or Low power) are optional features of this family. All of this family have $\overline{CAS}$-before-$\overline{RAS}$ refresh, $\overline{RAS}$-only refresh and Hidden refresh capabilities. Furthermore, Self-refresh operation is available in L-version. This 4Mx16 EDO Mode DRAM family is fabricated using Samsung's advanced CMOS process to realize high band-width, low power consumption and high reliability.

NOTES

1. An initial pause of 200us is required after power-up followed by any 8 $\overline{RAS}$-only or $\overline{CAS}$-before-$\overline{RAS}$ refresh cycles before proper device operation is achieved.

2. Input voltage levels are Vih/Vil. V_{IH}(min) and V_{IL}(max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH}(min) and V_{IL}(max) and are assumed to be 2ns for all inputs.

3. Measured with a load equivalent to 1 TTL load and 100pF.

4. Operation within the t_{RCD}(max) limit insures that t_{RAC}(max) can be met. t_{RCD}(max) is specified as a reference point only. If t_{RCD} is greater than the specified t_{RCD}(max) limit, then access time is controlled exclusively by t_{CAC}.

5. Assumes that $t_{RCD} \geq t_{RCD}$(max).

6. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V_{oh} or V_{ol}.

7. t_{WCS}, t_{RWD}, t_{CWD} and t_{AWD} are non restrictive operating parameters. They are included in the data sheet as electric charac-teristics only. If $t_{WCS} \geq t_{WCS}$(min), the cycles is an early write cycle and the data output will remain high impedance for the duration of the cycle. If $t_{CWD} \geq t_{CWD}$(min), $t_{RWD} \geq t_{RWD}$(min) and $t_{AWD} \geq t_{AWD}$(min), then the cycle is a read-modify-write cycle and the data output will contain the data read from the selected address. If neither of the above conditions is satisfied, the condition of the data out is indeterminate.

8. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.

9. This parameters are referenced to the $\overline{CAS}$ leading edge in early write cycles and to the $\overline{W}$ falling edge in $\overline{OE}$ controlled write cycle and read-modify-write cycles.

10. Operation within the t_{RAD}(max) limit insures that t_{RAC}(max) can be met. t_{RAD}(max) is specified as a reference point only. If t_{RAD} is greater than the specified t_{RAD}(max) limit, then access time is controlled by t_{AA}.

11. These specifiecations are applied in the test mode.

12. In test mode read cycle, the value of t_{RAC}, t_{AA}, t_{CAC} is delayed by 2ns to 5ns for the specified values. These parameters should be specified in test mode cycles by adding the above value to the specified value in this data sheet.

13. t_{ASC}, t_{CAH} are referenced to the earlier $\overline{CAS}$ falling edge.

14. t_{CP} is specified from the last $\overline{CAS}$ rising edge in the previous cycle to the first $\overline{CAS}$ falling edge in the next cycle.

15. t_{CWD} is referenced to the later $\overline{CAS}$ falling edge at word read-modify-write cycle.

16. t_{CWL} is specified from $\overline{W}$ falling edge to the earlier $\overline{CAS}$ rising edge.

17. t_{CSR} is referenced to earlier $\overline{CAS}$ falling before $\overline{RAS}$ transition low.

18. t_{CHR} is referenced to the later $\overline{CAS}$ rising high after $\overline{RAS}$ transition low.
19. t_{DS} is specified for the earlier $\overline{CAS}$ falling edge and t_{DH} is specified by the later $\overline{CAS}$ falling edge in early write cycle.

20. If $\overline{RAS}$ goes high before $\overline{CAS}$ high going, the open circuit condition of the output is achieved by $\overline{CAS}$ high going.

21. $t_{ASC} \geq 6ns$, Assume $t_T = 2.0ns$, if $t_{ASC} \leq 6ns$, then $t_{HPC}(min)$ and $t_{CAS}(min)$ must be increased by the value of "6ns-t_{ASC}".

22. If $t_{RASS} \geq 100us$, then $\overline{RAS}$ precharge time must use t_{RPS} instead of t_{RP}.

23. For $\overline{RAS}$-only-Refresh and Burst $\overline{CAS}$-before-$\overline{RAS}$ refresh mode, 4096 cycles(4K/8K) of burst refresh must be executed within 64ms before and after self refresh, in order to meet refresh specification.

24. For distributed $\overline{CAS}$-before-$\overline{RAS}$ with 15.6us interval, CBR refresh should be executed with in 15.6us immediately before and after self refresh in order to meet refresh specification.
